

General-Purpose AC Servo

MITSUBISHI SERVO AMPLIFIERS & MOTORS

**MELSERVO-J4**

SSCNET III/H Interface

MODEL

**MR-J4-\_B\_(-RJ)**

SERVO AMPLIFIER

INSTRUCTION MANUAL

## ● Safety Instructions ●

Please read the instructions carefully before using the equipment.

To use the equipment correctly, do not attempt to install, operate, maintain, or inspect the equipment until you have read through this Instruction Manual, Installation guide, and appended documents carefully. Do not use the equipment until you have a full knowledge of the equipment, safety information and instructions. In this Instruction Manual, the safety instruction levels are classified into "WARNING" and "CAUTION".

Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.

Indicates that incorrect handling may cause hazardous conditions, resulting in medium or slight injury to personnel or may cause physical damage.

Note that the CAUTION level may lead to a serious consequence according to conditions. Please follow the instructions of both levels because they are important to personnel safety. What must not be done and what must be done are indicated by the following diagrammatic symbols.

Indicates what must not be done. For example, "No Fire" is indicated by .

Indicates what must be done. For example, grounding is indicated by .

In this Instruction Manual, instructions at a lower level than the above, instructions for other functions, and so on are classified into "POINT".

After reading this Instruction Manual, keep it accessible to the operator.

## 1. To prevent electric shock, note the following

### WARNING

- Before wiring and inspections, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- Ground the servo amplifier and servo motor securely.
- Any person who is involved in wiring and inspection should be fully competent to do the work.
- Do not attempt to wire the servo amplifier and servo motor until they have been installed. Otherwise, it may cause an electric shock.
- Do not operate switches with wet hands. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- During power-on or operation, do not open the front cover of the servo amplifier. Otherwise, it may cause an electric shock.
- Do not operate the servo amplifier with the front cover removed. High-voltage terminals and charging area are exposed and you may get an electric shock.
- Except for wiring and periodic inspection, do not remove the front cover of the servo amplifier even if the power is off. The servo amplifier is charged and you may get an electric shock.
- To prevent an electric shock, always connect the protective earth (PE) terminal (marked  $\oplus$ ) of the servo amplifier to the protective earth (PE) of the cabinet.
- To avoid an electric shock, insulate the connections of the power supply terminals.

## 2. To prevent fire, note the following

### CAUTION

- Install the servo amplifier, servo motor, and regenerative resistor on incombustible material. Installing them directly or close to combustibles will lead to smoke or a fire.
- Always connect a magnetic contactor between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- Always connect a molded-case circuit breaker, or a fuse to each servo amplifier between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a molded-case circuit breaker or fuse is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a regenerative transistor malfunction or the like may overheat the regenerative resistor, causing smoke or a fire.
- Provide adequate protection to prevent screws and other conductive matter, oil and other combustible matter from entering the servo amplifier and servo motor.

### 3. To prevent injury, note the following

#### CAUTION

- Only the power/signal specified in the Instruction Manual should be applied to each terminal. Otherwise, it may cause an electric shock, fire, injury, etc.
- Connect cables to the correct terminals. Otherwise, a burst, damage, etc., may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc., may occur.
- The servo amplifier heat sink, regenerative resistor, servo motor, etc., may be hot while the power is on and for some time after power-off. Take safety measures such as providing covers to avoid accidentally touching them by hands and parts such as cables.

### 4. Additional instructions

The following instructions should also be fully noted. Incorrect handling may cause a malfunction, injury, electric shock, fire, etc.

#### (1) Transportation and installation

#### CAUTION

- Transport the products correctly according to their mass.
- Stacking in excess of the specified number of product packages is not allowed.
- Do not hold the front cover, cables, or connectors when carrying the servo amplifier. Otherwise, it may drop.
- Install the servo amplifier and the servo motor in a load-bearing place in accordance with the Instruction Manual.
- Do not get on or put heavy load on the product. Otherwise, it may cause injury.
- The equipment must be installed in the specified direction.
- Maintain specified clearances between the servo amplifier and the inner surfaces of a control cabinet or other equipment.
- Do not install or operate the servo amplifier and servo motor which have been damaged or have any parts missing.
- Do not block the intake and exhaust areas of the servo amplifier. Otherwise, it may cause a malfunction.
- Do not drop or apply heavy impact on the servo amplifiers and the servo motors. Otherwise, it may cause injury, malfunction, etc.
- Do not strike the connector. Otherwise, it may cause a connection failure, malfunction, etc.
- When you keep or use the equipment, please fulfill the following environment.

| Item                 |           | Environment                                                                                    |
|----------------------|-----------|------------------------------------------------------------------------------------------------|
| Ambient temperature  | Operation | 0 °C to 55 °C (non-freezing)                                                                   |
|                      | Storage   | -20 °C to 65 °C (non-freezing)                                                                 |
| Ambient humidity     | Operation | 5 %RH to 90 %RH (non-condensing)                                                               |
|                      | Storage   |                                                                                                |
| Ambience             |           | Indoors (no direct sunlight), free from corrosive gas, flammable gas, oil mist, dust, and dirt |
| Altitude             |           | 2000 m or less above sea level (Contact your local sales office for the altitude for options.) |
| Vibration resistance |           | 5.9 m/s <sup>2</sup> , at 10 Hz to 55 Hz (X, Y, Z axes)                                        |

- When the product has been stored for an extended period of time, contact your local sales office.
- When handling the servo motor, be careful with the sharp edges of the servo motor.
- The servo amplifier must be installed in a metal cabinet.

## ⚠ CAUTION

- When fumigants that contain halogen materials, such as fluorine, chlorine, bromine, and iodine, are used for disinfecting and protecting wooden packaging from insects, they cause a malfunction when entering our products. Please take necessary precautions to ensure that remaining materials from fumigant do not enter our products, or treat packaging with methods other than fumigation, such as heat treatment. Additionally, disinfect and protect wood from insects before packing the products.
- To prevent a fire or injury in case of an earthquake or other natural disasters, securely install, mount, and wire the servo motor in accordance with the Instruction Manual.

### (2) Wiring

## ⚠ CAUTION

- Wire the equipment correctly and securely. Otherwise, the servo motor may operate unexpectedly.
- Make sure to connect the cables and connectors by using the fixing screws and the locking mechanism. Otherwise, the cables and connectors may be disconnected during operation.
- Do not install a power capacitor, surge killer, or radio noise filter (optional FR-BIF(-H)) on the servo amplifier output side.
- To avoid a malfunction, connect the wires to the correct phase terminals (U/V/W) of the servo amplifier and servo motor.
- Connect the servo amplifier power output (U/V/W) to the servo motor power input (U/V/W) directly. Do not connect a magnetic contactor and others between them. Otherwise, it may cause a malfunction.

- The connection diagrams in this Instruction Manual are shown for sink interfaces, unless stated otherwise.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the converter unit and the drive unit will malfunction and will not output signals, disabling the emergency stop and other protective circuits.

- When the wires are not tightened enough to the terminal block, the wires or terminal block may generate heat because of the poor contact. Be sure to tighten the wires with specified torque.
- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- Configure a circuit to turn off EM2 or EM1 when the main circuit power supply is turned off to prevent an unexpected restart of the servo amplifier.
- To prevent malfunction, avoid bundling power lines (input/output) and signal cables together or running them in parallel to each other. Separate the power lines from the signal cables.

### (3) Test run and adjustment

#### CAUTION

- When executing a test run, follow the notice and procedures in this instruction manual. Otherwise, it may cause a malfunction, damage to the machine, or injury.
- Before operation, check and adjust the parameter settings. Improper settings may cause some machines to operate unexpectedly.
- Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.
- Do not get close to moving parts during the servo-on status.

### (4) Usage

#### CAUTION

- Provide an external emergency stop circuit to stop the operation and shut the power off immediately.
- For equipment in which the moving part of the machine may collide against the load side, install a limit switch or stopper to the end of the moving part. The machine may be damaged due to a collision.
- Do not disassemble, repair, or modify the product. Otherwise, it may cause an electric shock, fire, injury, etc. Disassembled, repaired, and/or modified products are not covered under warranty.
- Before resetting an alarm, make sure that the run signal of the servo amplifier is off in order to prevent a sudden restart. Otherwise, it may cause an accident.
- Use a noise filter, etc., to minimize the influence of electromagnetic interference. Electromagnetic interference may affect the electronic equipment used near the servo amplifier.
- Do not burn or destroy the servo amplifier. Doing so may generate a toxic gas.
- Use the servo amplifier with the specified servo motor.
- Wire options and peripheral equipment, etc. correctly in the specified combination. Otherwise, it may cause an electric shock, fire, injury, etc.
- The electromagnetic brake on the servo motor is designed to hold the motor shaft and should not be used for ordinary braking.
- For such reasons as incorrect wiring, service life, and mechanical structure (e.g. where a ball screw and the servo motor are coupled via a timing belt), the electromagnetic brake may not hold the motor shaft. To ensure safety, install a stopper on the machine side.
- If the dynamic brake is activated at power-off, alarm occurrence, etc., do not rotate the servo motor by an external force. Otherwise, it may cause a fire.

## (5) Corrective actions

### CAUTION

- Ensure safety by confirming the power off, etc. before performing corrective actions. Otherwise, it may cause an accident.
- If it is assumed that a power failure, machine stoppage, or product malfunction may result in a hazardous situation, use a servo motor with an electromagnetic brake or provide an external brake system for holding purpose to prevent such hazard.
- Configure an electromagnetic brake circuit which is interlocked with an external emergency stop switch.

- When an alarm occurs, eliminate its cause, ensure safety, and deactivate the alarm to restart operation.
- If the molded-case circuit breaker or fuse is activated, be sure to remove the cause and secure safety before switching the power on. If necessary, replace the servo amplifier and recheck the wiring. Otherwise, it may cause smoke, fire, or an electric shock.
- Provide an adequate protection to prevent unexpected restart after an instantaneous power failure.
- After an earthquake or other natural disasters, ensure safety by checking the conditions of the installation, mounting, wiring, and equipment before switching the power on to prevent an electric shock, injury, or fire.

## (6) Maintenance, inspection and parts replacement

### CAUTION

- Make sure that the emergency stop circuit operates properly such that an operation can be stopped immediately and a power is shut off by the emergency stop switch.
- It is recommended that the servo amplifier be replaced every 10 years when it is used in general environment.
- When using the servo amplifier that has not been energized for an extended period of time, contact your local sales office.

## (7) General instruction

- To illustrate details, the equipment in the diagrams of this Instruction Manual may have been drawn without covers and safety guards. When the equipment is operated, the covers and safety guards must be installed as specified. Operation must be performed in accordance with this Instruction Manual.

## ● DISPOSAL OF WASTE ●

Please dispose a servo amplifier, battery (primary battery) and other options according to your local laws and regulations.

### EEP-ROM life

The number of write times to the EEPROM, which stores parameter settings, etc., is limited to 100,000. If the total number of the following operations exceeds 100,000, the servo amplifier may malfunction when the EEPROM reaches the end of its useful life.

- Write to the EEPROM due to parameter setting changes
- Write to the EEPROM due to device changes

### STO function of the servo amplifier

The servo amplifier complies with safety integrity level 3 (SIL 3) of the IEC 61508:2010 functional safety standard.

Refer to app. 14 for schedule.

When using the STO function of the servo amplifier, refer to chapter 13.

For the MR-J3-D05 safety logic unit, refer to app. 5.

### Compliance with global standards

For the compliance with global standards, refer to app. 4.

### «About the manuals»

You must have this Instruction Manual and the following manuals to use this servo. Ensure to prepare them to use the servo safely.

#### Relevant manuals

| Manual name                                                          | Manual No.      |
|----------------------------------------------------------------------|-----------------|
| MELSERVO MR-D30 Instruction Manual (Note 5)                          | SH(NA)030132ENG |
| MELSERVO MR-CV_/MR-CR55K_/MR-J4-DU_(-RJ) Instruction Manual (Note 6) | SH(NA)030153ENG |
| MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)     | SH(NA)030109ENG |
| MELSERVO Servo Motor Instruction Manual (Vol. 3) (Note 1)            | SH(NA)030113ENG |
| MELSERVO Linear Servo Motor Instruction Manual (Note 2)              | SH(NA)030110ENG |
| MELSERVO Direct Drive Motor Instruction Manual (Note 3)              | SH(NA)030112ENG |
| MELSERVO Linear Encoder Instruction Manual (Note 2, 4)               | SH(NA)030111ENG |
| MELSERVO EMC Installation Guidelines                                 | IB(NA)67310ENG  |

- Note
1. It is necessary for using a rotary servo motor.
  2. It is necessary for using a linear servo motor.
  3. It is necessary for using a direct drive motor.
  4. It is necessary for using a fully closed loop system.
  5. It is necessary for using an MR-D30 functional safety unit.
  6. It is necessary for using an MR-CV\_ power regeneration converter unit/MR-CR\_ resistance regeneration converter unit, and MR-J4-DU\_B\_(-RJ) drive unit.

#### «Wiring»

Wires mentioned in this Instruction Manual are selected based on the ambient temperature of 40 °C.

#### «U.S. customary units»

U.S. customary units are not shown in this manual. Convert the values if necessary according to the following table.

| Quantity                      | SI (metric) unit                                   | U.S. customary unit            |
|-------------------------------|----------------------------------------------------|--------------------------------|
| Mass                          | 1 [kg]                                             | 2.2046 [lb]                    |
| Length                        | 1 [mm]                                             | 0.03937 [inch]                 |
| Torque                        | 1 [N•m]                                            | 141.6 [oz•inch]                |
| Moment of inertia             | 1 [ $(\times 10^{-4} \text{ kg}\cdot\text{m}^2)$ ] | 5.4675 [oz•inch <sup>2</sup> ] |
| Load (thrust load/axial load) | 1 [N]                                              | 0.2248 [lbf]                   |
| Temperature                   | N [ $^{\circ}\text{C}$ ] $\times 9/5 + 32$         | N [ $^{\circ}\text{F}$ ]       |

## CONTENTS

|                                                                                                                |                     |

| 6.3.2 Auto tuning mode basis .....                                         | 6-19 |
| 6.3.3 Adjustment procedure by auto tuning .....                            | 6-20 |
| 6.3.4 Response level setting in auto tuning mode .....                     | 6-21 |
| 6.4 Manual mode .....                                                      | 6-22 |
| 6.5 2 gain adjustment mode .....                                           | 6-25 |

## 7. SPECIAL ADJUSTMENT FUNCTIONS

7- 1 to 7-38

|                                                              |      |
|--------------------------------------------------------------|------|
| 7.1 Filter setting .....                                     | 7- 1 |
| 7.1.1 Machine resonance suppression filter .....             | 7- 2 |
| 7.1.2 Adaptive filter II .....                               | 7- 5 |
| 7.1.3 Shaft resonance suppression filter .....               | 7- 7 |
| 7.1.4 Low-pass filter .....                                  | 7- 8 |
| 7.1.5 Advanced vibration suppression control II .....        | 7- 8 |
| 7.1.6 Command notch filter .....                             | 7-13 |
| 7.2 Gain switching function .....                            | 7-15 |
| 7.2.1 Applications .....                                     | 7-15 |
| 7.2.2 Function block diagram .....                           | 7-16 |
| 7.2.3 Parameter .....                                        | 7-17 |
| 7.2.4 Gain switching procedure .....                         | 7-20 |
| 7.3 Tough drive function .....                               | 7-24 |
| 7.3.1 Vibration tough drive function .....                   | 7-24 |
| 7.3.2 Instantaneous power failure tough drive function ..... | 7-26 |
| 7.4 Compliance with SEMI-F47 standard .....                  | 7-30 |
| 7.5 Model adaptive control disabled .....                    | 7-33 |
| 7.6 Lost motion compensation function .....                  | 7-34 |
| 7.7 Super trace control .....                                | 7-37 |

## 8. TROUBLESHOOTING

8- 1 to 8-16

|                                       |      |
|---------------------------------------|------|
| 8.1 Explanation for the lists .....   | 8- 1 |
| 8.2 Alarm list .....                  | 8- 2 |
| 8.3 Warning list .....                | 8-12 |
| 8.4 Troubleshooting at power on ..... | 8-15 |

## 9. DIMENSIONS

9- 1 to 9-22

|                           |      |
|---------------------------|------|
| 9.1 Servo amplifier ..... | 9- 1 |
| 9.2 Connector .....       | 9-20 |

## 10. CHARACTERISTICS

10- 1 to 10-16

|                                                     |       |
|-----------------------------------------------------|-------|
| 10.1 Overload protection characteristics .....      | 10- 1 |
| 10.2 Power supply capacity and generated loss ..... | 10- 5 |

|                                                                               |       |
|-------------------------------------------------------------------------------|-------|
| 10.3 Dynamic brake characteristics .....                                      | 10- 8 |
| 10.3.1 Dynamic brake operation .....                                          | 10- 9 |
| 10.3.2 Permissible load to motor inertia when the dynamic brake is used ..... | 10-12 |
| 10.4 Cable bending life .....                                                 | 10-13 |
| 10.5 Inrush currents at power-on of main circuit and control circuit .....    | 10-14 |

## 11. OPTIONS AND PERIPHERAL EQUIPMENT

11- 1 to 11-110

|                                                                      |        |
|----------------------------------------------------------------------|--------|
| 11.1 Cable/connector sets .....                                      | 11- 1  |
| 11.1.1 Combinations of cable/connector sets .....                    | 11- 2  |
| 11.1.2 MR-D05UDL3M-B STO cable .....                                 | 11- 6  |
| 11.1.3 SSCNET III cable .....                                        | 11- 7  |
| 11.1.4 Battery cable/junction battery cable .....                    | 11- 9  |
| 11.2 Regenerative options .....                                      | 11-10  |
| 11.2.1 Combination and regenerative power .....                      | 11-10  |
| 11.2.2 Selection of regenerative option .....                        | 11-12  |
| 11.2.3 Parameter setting .....                                       | 11-16  |
| 11.2.4 Connection of regenerative option .....                       | 11-16  |
| 11.2.5 Dimensions .....                                              | 11-21  |
| 11.3 FR-BU2-(H) brake unit .....                                     | 11-25  |
| 11.3.1 Selection .....                                               | 11-25  |
| 11.3.2 Brake unit parameter setting .....                            | 11-26  |
| 11.3.3 Connection example .....                                      | 11-27  |
| 11.3.4 Dimensions .....                                              | 11-35  |
| 11.4 FR-RC-(H) power regeneration converter .....                    | 11-38  |
| 11.5 FR-CV-(H) power regeneration common converter .....             | 11-42  |
| 11.5.1 Model designation .....                                       | 11-43  |
| 11.5.2 Selection .....                                               | 11-43  |
| 11.6 Junction terminal block PS7DW-20V14B-F (recommended) .....      | 11-51  |
| 11.7 MR Configurator2 .....                                          | 11-52  |
| 11.7.1 Specifications .....                                          | 11-52  |
| 11.7.2 System configuration .....                                    | 11-53  |
| 11.7.3 Precautions for using USB communication function .....        | 11-54  |
| 11.8 Battery .....                                                   | 11-55  |
| 11.8.1 Selection of battery .....                                    | 11-55  |
| 11.8.2 MR-BAT6V1SET battery .....                                    | 11-55  |
| 11.8.3 MR-BAT6V1BJ battery for junction battery cable .....          | 11-59  |
| 11.8.4 MR-BT6VCASE battery case .....                                | 11-63  |
| 11.8.5 MR-BAT6V1 battery .....                                       | 11-69  |
| 11.9 Selection example of wires .....                                | 11-70  |
| 11.10 Molded-case circuit breakers, fuses, magnetic contactors ..... | 11-74  |
| 11.11 Power factor improving DC reactors .....                       | 11-77  |
| 11.12 Power factor improving AC reactors .....                       | 11-79  |
| 11.13 Relay (recommended) .....                                      | 11-82  |
| 11.14 Noise reduction techniques .....                               | 11-83  |
| 11.15 Earth-leakage current breaker .....                            | 11-90  |
| 11.16 EMC filter (recommended) .....                                 | 11-93  |
| 11.17 External dynamic brake .....                                   | 11-100 |
| 11.18 Panel through attachment (MR-J4ACN15K/MR-J3ACN) .....          | 11-106 |

**12. ABSOLUTE POSITION DETECTION SYSTEM****12- 1 to 12- 6**

|                                                                   |       |
|-------------------------------------------------------------------|-------|
| 12.1 Summary.....                                                 | 12- 1 |
| 12.1.1 Features .....                                             | 12- 1 |
| 12.1.2 Structure.....                                             | 12- 2 |
| 12.1.3 Parameter setting.....                                     | 12- 2 |
| 12.1.4 Confirmation of absolute position detection data.....      | 12- 2 |
| 12.2 Battery.....                                                 | 12- 3 |
| 12.2.1 Using MR-BAT6V1SET battery.....                            | 12- 3 |
| 12.2.2 Using MR-BAT6V1BJ battery for junction battery cable ..... | 12- 4 |
| 12.2.3 Using MR-BT6VCASE battery case.....                        | 12- 5 |

**13. USING STO FUNCTION****13- 1 to 13-14**

|                                                                                          |       |
|------------------------------------------------------------------------------------------|-------|
| 13.1 Introduction .....                                                                  | 13- 1 |
| 13.1.1 Summary .....                                                                     | 13- 1 |
| 13.1.2 Terms related to safety .....                                                     | 13- 1 |
| 13.1.3 Cautions .....                                                                    | 13- 1 |
| 13.1.4 Residual risks of the STO function.....                                           | 13- 2 |
| 13.1.5 Specifications .....                                                              | 13- 3 |
| 13.1.6 Maintenance.....                                                                  | 13- 4 |
| 13.2 STO I/O signal connector (CN8) and signal layouts.....                              | 13- 4 |
| 13.2.1 Signal layouts.....                                                               | 13- 4 |
| 13.2.2 Signal (device) explanations .....                                                | 13- 5 |
| 13.2.3 How to pull out the STO cable .....                                               | 13- 5 |
| 13.3 Connection example.....                                                             | 13- 6 |
| 13.3.1 Connection example for CN8 connector.....                                         | 13- 6 |
| 13.3.2 External I/O signal connection example using an MR-J3-D05 safety logic unit ..... | 13- 7 |
| 13.3.3 External I/O signal connection example using an external safety relay unit .....  | 13-10 |
| 13.3.4 External I/O signal connection example using a motion controller .....            | 13-11 |
| 13.4 Detailed description of interfaces .....                                            | 13-12 |
| 13.4.1 Sink I/O interface.....                                                           | 13-12 |
| 13.4.2 Source I/O interface .....                                                        | 13-14 |

**14. USING A LINEAR SERVO MOTOR****14- 1 to 14-34**

|                                                       |       |
|-------------------------------------------------------|-------|
| 14.1 Functions and configuration .....                | 14- 1 |
| 14.1.1 Summary .....                                  | 14- 1 |
| 14.1.2 Servo system with auxiliary equipment.....     | 14- 2 |
| 14.2 Signals and wiring.....                          | 14- 6 |
| 14.3 Operation and functions.....                     | 14- 8 |
| 14.3.1 Startup.....                                   | 14- 8 |
| 14.3.2 Magnetic pole detection .....                  | 14-11 |
| 14.3.3 Home position return.....                      | 14-20 |
| 14.3.4 Test operation mode in MR Configurator2.....   | 14-24 |
| 14.3.5 Operation from controller .....                | 14-25 |
| 14.3.6 Function.....                                  | 14-27 |
| 14.3.7 Absolute position detection system.....        | 14-29 |
| 14.4 Characteristics .....                            | 14-30 |
| 14.4.1 Overload protection characteristics .....      | 14-30 |
| 14.4.2 Power supply capacity and generated loss ..... | 14-31 |

|                                                                                  |       |
|----------------------------------------------------------------------------------|-------|
| 14.4.3 Dynamic brake characteristics .....                                       | 14-32 |
| 14.4.4 Permissible load to motor mass ratio when the dynamic brake is used ..... | 14-33 |

|                                       |                       |
|---------------------------------------|-----------------------|
| <b>15. USING A DIRECT DRIVE MOTOR</b> | <b>15- 1 to 15-22</b> |
|---------------------------------------|-----------------------|

|                                                       |       |
|-------------------------------------------------------|-------|
| 15.1 Functions and configuration .....                | 15- 1 |
| 15.1.1 Summary .....                                  | 15- 1 |
| 15.1.2 Servo system with auxiliary equipment.....     | 15- 2 |
| 15.2 Signals and wiring.....                          | 15- 3 |
| 15.3 Operation and functions.....                     | 15- 4 |
| 15.3.1 Startup procedure .....                        | 15- 5 |
| 15.3.2 Magnetic pole detection .....                  | 15- 6 |
| 15.3.3 Operation from controller .....                | 15-14 |
| 15.3.4 Function.....                                  | 15-15 |
| 15.4 Characteristics .....                            | 15-17 |

## 1. FUNCTIONS AND CONFIGURATION

### 1.1 Summary

The Mitsubishi Electric MELSERVO-J4 series general-purpose AC servo has further higher performance and higher functions compared to the previous MELSERVO-J3 series.

MR-J4-\_B\_ servo amplifier is connected to controllers, including a servo system controller, on the high-speed synchronous network SSCNET III/H. The servo amplifier directly receives a command from a controller to drive a servo motor.

MELSERVO-J4 series compatible rotary servo motor is equipped with 22-bit (4194304 pulses/rev) high-resolution absolute encoder. In addition, speed frequency response is increased to 2.5 kHz. Thus, faster and more accurate control is enabled as compared to MELSERVO-J3 series.

MR-J4-\_B\_ servo amplifier operates MELSERVO-J4 series compatible rotary servo motors, linear servo motors, and direct drive motors as standard.

With one-touch tuning and real-time auto tuning, you can automatically adjust the servo gains according to the machine.

The tough drive function and the drive recorder function, which are well-received in the MELSERVO-JN series, have been improved. The MR-J4 servo amplifier supports the improved functions. Additionally, the preventive maintenance support function detects an error in the machine parts. This function provides strong support for the machine maintenance and inspection.

SSCNET III/H achieves high-speed communication of 150 Mbps full duplex with high noise tolerance due to the SSCNET III optical cables. Large amounts of data are exchanged in real-time between the controller and the servo amplifier. Servo monitor information is stored in the upper information system and is used for control.

On the SSCNET III/H network, the stations are connected with a maximum distance of 100 m between them. This allows you to create a large system.

The MR-J4-\_B\_ servo amplifier supports the STO (Safe Torque Off) function. When the servo amplifier is connected to a SSCNET III/H-compatible servo system controller, in addition to the STO function, the servo amplifier also supports the SS1 (Safe Stop 1), SS2 (Safe Stop 2), SOS (Safe Operating Stop), SLS (Safely-Limited Speed), SBC (Safe Brake Control) and SSM (Safe Speed Monitor) functions.

The servo amplifier has a USB communication interface. Therefore, you can connect the servo amplifier to the personal computer with MR Configurator2 installed to perform the parameter setting, test operation, gain adjustment, and others.

In MELSERVO-J4 series, servo amplifiers with CN2L connector is also available as MR-J4-\_B\_-RJ. By using CN2L connector, an A/B/Z-phase differential output method external encoder can be connected to the servo amplifier. In a fully closed loop system, a four-wire type external encoder is connectable as well. The following table indicates the communication method of the external encoder compatible with MR-J4-\_B\_ and MR-J4-\_B\_-RJ servo amplifiers.

# 1. FUNCTIONS AND CONFIGURATION

Table 1.1 Connectors to connect external encoders

| Operation mode             | External encoder communication method  | Connector                                                                          |               |
|----------------------------|----------------------------------------|------------------------------------------------------------------------------------|---------------|
|                            |                                        | MR-J4-_B_                                                                          | MR-J4-_B_-RJ  |
| Linear servo motor system  | Two-wire type                          | CN2 (Note 1)                                                                       | CN2 (Note 1)  |
|                            | Four-wire type                         |  | CN2L (Note 6) |
|                            | A/B/Z-phase differential output method |                                                                                    |               |
| Fully closed loop system   | Two-wire type                          | CN2 (Note 2, 3, 4)                                                                 | CN2L          |
|                            | Four-wire type                         |  |               |
|                            | A/B/Z-phase differential output method |                                                                                    |               |
| Scale measurement function | Two-wire type                          | CN2 (Note 2, 3, 5)                                                                 | CN2L (Note 5) |
|                            | Four-wire type                         |  |               |
|                            | A/B/Z-phase differential output method |                                                                                    |               |

- Note
1. The MR-J4THCBL03M branch cable is necessary.
  2. The MR-J4FCCBL03M branch cable is necessary.
  3. When the communication method of the servo motor encoder is four-wire type, MR-J4-\_B\_ cannot be used. Use an MR-J4-\_B\_-RJ.
  4. This is used with servo amplifiers with software version A3 or later.
  5. This is used with servo amplifiers with software version A8 or later.
  6. Connect a thermistor to CN2.

# 1. FUNCTIONS AND CONFIGURATION

## 1.2 Function block diagram

The function block diagram of this servo is shown below.

### POINT

- The diagram shows for MR-J4-\_B\_-RJ as an example. MR-J4-\_B\_ servo amplifier does not have CN2L connector.

(1) 200 V class

(a) MR-J4-500B(-RJ) or less

# 1. FUNCTIONS AND CONFIGURATION

---

- Note
1. The built-in regenerative resistor is not provided for MR-J4-10B(-RJ).
  2. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to section 1.3 for the power supply specifications.
  3. Servo amplifiers MR-J4-70B(-RJ) or more have a cooling fan.
  4. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
  5. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector.
  6. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

# 1. FUNCTIONS AND CONFIGURATION

## (b) MR-J4-700B(-RJ)

Note 1. Refer to section 1.3 for the power supply specifications.

Note 2. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.

Note 3. This is for MR-J4- \_B-RJ servo amplifier. MR-J4- \_B servo amplifier does not have CN2L connector.

Note 4. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

# 1. FUNCTIONS AND CONFIGURATION

(c) MR-J4-11KB(-RJ)/MR-J4-15KB(-RJ)/MR-J4-22KB(-RJ)

# 1. FUNCTIONS AND CONFIGURATION

---

Note 1. Refer to section 1.3 for the power supply specifications.

2. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
3. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector.
4. Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to chapter 8.
5. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
6. The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

# 1. FUNCTIONS AND CONFIGURATION

(2) 400 V class

(a) MR-J4-350B4(-RJ) or less

Note 1. Refer to section 1.3 for the power supply specification.

Note 2. Servo amplifiers MR-J4-200B4(-RJ) or more have a cooling fan.

Note 3. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.

Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector.

Note 5. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

# 1. FUNCTIONS AND CONFIGURATION

(b) MR-J4-500B4(-RJ)/MR-J4-700B4(-RJ)

- Note 1. Refer to section 1.3 for the power supply specification.
- Note 2. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
- Note 3. This is for MR-J4- \_B4-RJ servo amplifier. MR-J4- \_B4 servo amplifier does not have CN2L connector.
- Note 4. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.

# 1. FUNCTIONS AND CONFIGURATION

(c) MR-J4-11KB4(-RJ)/MR-J4-15KB4(-RJ)/MR-J4-22KB4(-RJ)

# 1. FUNCTIONS AND CONFIGURATION

---

Note 1. Refer to section 1.3 for the power supply specification.

2. MR-J4 servo amplifier has P3 and P4 in the upstream of the inrush current suppression circuit. They are different from P1 and P2 of MR-J3 servo amplifiers.
3. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector.
4. Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at an alarm occurrence for which the servo motor does not decelerate to stop. Ensure the safety in the entire equipment. For alarms for which the servo motor does not decelerate to stop, refer to chapter 8.
5. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
6. The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.

- Note 1. 0.3 A is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points.
2. When closely mounting the servo amplifiers, operate them at the ambient temperature of 0 °C to 45 °C or at 75% or smaller effective load ratio.
3. Test pulse is a signal which instantaneously turns off a signal to the servo amplifier at a constant period for external circuit to self-diagnose.
4. Except for the terminal block.
5. MR-J4-\_B servo amplifier is compatible only with two-wire type. MR-J4-\_B-RJ servo amplifier is compatible with two-wire type, four-wire type, and A/B/Z-phase differential output method. Refer to table 1.1 for details.
6. The rated current is 2.9 A when the servo amplifier is used with UL or CSA compliant servo motor.
7. For the compatible version of fully closed loop system, refer to table 1.1. Check the software version of the servo amplifier with MR Configurator2.
8. The communication cycle depends on the controller specifications and the number of axes connected.
9. Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at emergency stop. Ensure the safety in the entire equipment.
10. For the compatible version for the scale measurement function, refer to table 1.1. Check the software version of the servo amplifier with MR Configurator2.
11. This value is applicable when a 3-phase power supply is used.
12. The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
13. When using 1-phase 200 V AC to 240 V AC power supply, operate the servo amplifier at 75% or smaller effective load ratio.
14. The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] in section 5.2.6.
15. Follow the restrictions in section 2.7 when using this product at altitude exceeding 1000 m and up to 2000 m above sea level.
16. The DC power supply input is available only with MR-J4-\_B-RJ servo amplifiers. For the connection example of the power circuit when a DC input is used, refer to app. 15.

- Note
1. 0.3 A is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points.
  2. Test pulse is a signal which instantaneously turns off a signal to the servo amplifier at a constant period for external circuit to self-diagnose.
  3. Except for the terminal block.
  4. MR-J4-B4 servo amplifier is compatible only with two-wire type. MR-J4-B4-RJ servo amplifier is compatible with two-wire type, four-wire type, and A/B/Z-phase differential output method. Refer to table 1.1 for details.
  5. The communication cycle depends on the controller specifications and the number of axes connected.
  6. Use an external dynamic brake for this servo amplifier. Failure to do so will cause an accident because the servo motor does not stop immediately but coasts at emergency stop. Ensure the safety in the entire equipment.
  7. For the compatible version for the scale measurement function, refer to table 1.1. Check the software version of the servo amplifier with MR Configurator2.
  8. The external dynamic brake cannot be used for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.
  9. The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] in section 5.2.6.
  10. Follow the restrictions in section 2.7 when using this product at altitude exceeding 1000 m and up to 2000 m above sea level.

# 1. FUNCTIONS AND CONFIGURATION

## (3) 100 V class

| Model: MR-J4-_-(-RJ)                      |                                                          | 10B1                                                                                                                                                                                                                                                                                                                                                                                        | 20B1 | 40B1 |

|                      | Ambience             |           | Indoors (no direct sunlight),<br>free from corrosive gas, flammable gas, oil mist, dust, and dirt |      |      |
|                      | Altitude             |           | 2000 m or less above sea level (Note 9)                                                           |      |      |
|                      | Vibration resistance |           | 5.9 m/s <sup>2</sup> , at 10 Hz to 55 Hz (directions of X, Y and Z axes)                          |      |      |
| Mass [kg]            |                      |           | 0.8                                                                                               |      | 1.0  |

- Note
1. 0.3 A is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points.
  2. When closely mounting the servo amplifiers, operate them at the ambient temperature of 0 °C to 45 °C or at 75% or smaller effective load ratio.
  3. Test pulse is a signal which instantaneously turns off a signal to the servo amplifier at a constant period for external circuit to self-diagnose.
  4. MR-J4-\_B servo amplifier is compatible only with two-wire type. MR-J4-\_B-RJ servo amplifier is compatible with two-wire type, four-wire type, and A/B/Z-phase differential output method. Refer to table 1.1 for details.
  5. For the compatible version of fully closed loop system, refer to table 1.1. Check the software version of the servo amplifier with MR Configurator2.
  6. The communication cycle depends on the controller specifications and the number of axes connected.
  7. For the compatible version for the scale measurement function, refer to table 1.1. Check the software version of the servo amplifier with MR Configurator2.
  8. The safety level depends on the setting value of [Pr. PF18 STO diagnosis error detection time] and whether STO input diagnosis by TOFB output is performed or not. For details, refer to the Function column of [Pr. PF18] in section 5.2.6.
  9. Follow the restrictions in section 2.7 when using this product at altitude exceeding 1000 m and up to 2000 m above sea level.

# 1. FUNCTIONS AND CONFIGURATION

## 1.4 Combinations of servo amplifiers and servo motors

### POINT

- When a 1-phase 200 V AC input is used, the maximum torque of 400% cannot be achieved with HG-JR series servo motor.
- When you use the MR-J4-100B(-RJ) or MR-J4-200B(-RJ) with the 1-phase 200 V AC input, contact your local sales office for the torque characteristics of the HG-UR series, HG-RR series, and HG-JR series servo motors.

### (1) 200 V class

- Note
1. This is available with servo amplifiers with software version C8 or later.
  2. This combination increases the maximum torque of the servo motor to 400%.
  3. This combination increases the rated torque and the maximum torque.

Note 1. This is available with servo amplifiers with software version C8 or later.

Note 2. This combination increases the rated torque and the maximum torque.

# 1. FUNCTIONS AND CONFIGURATION

## 1.5 Function list

The following table lists the functions of this servo. For details of the functions, refer to each section of the detailed description field.

| Function                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Detailed explanation     |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Model adaptive control                    | This realizes a high response and stable control following the ideal model. The two-degrees-of-freedom-model model adaptive control enables you to set a response to the command and response to the disturbance separately. Additionally, this function can be disabled. Refer to section 7.5 for disabling this function. This is used with servo amplifiers with software version B4 or later. Check the software version of the servo amplifier with MR Configurator2. |                          |
| Position control mode                     | This servo amplifier is used as a position control servo.                                                                                                                                                                                                                                                                                                                                                                                                                  |                          |
| Speed control mode                        | This servo amplifier is used as a speed control servo.                                                                                                                                                                                                                                                                                                                                                                                                                     |                          |
| Torque control mode                       | This servo amplifier is used as a torque control servo.                                                                                                                                                                                                                                                                                                                                                                                                                    |                          |
| High-resolution encoder                   | High-resolution encoder of 4194304 pulses/rev is used as the encoder of the rotary servo motor compatible with the MELSERVO-J4 series.                                                                                                                                                                                                                                                                                                                                     |                          |
| Absolute position detection system        | Merely setting a home position once makes home position return unnecessary at every power-on.                                                                                                                                                                                                                                                                                                                                                                              | Chapter 12               |
| Gain switching function                   | You can switch gains during rotation and during stop, and can use an input device to switch gains during operation.                                                                                                                                                                                                                                                                                                                                                        | Section 7.2              |
| Advanced vibration suppression control II | This function suppresses vibration at the arm end or residual vibration.                                                                                                                                                                                                                                                                                                                                                                                                   | Section 7.1.5            |
| Machine resonance suppression filter      | This is a filter function (notch filter) which decreases the gain of the specific frequency to suppress the resonance of the mechanical system.                                                                                                                                                                                                                                                                                                                            | Section 7.1.1            |
| Shaft resonance suppression filter        | When a load is mounted to the servo motor shaft, resonance by shaft torsion during driving may generate a mechanical vibration at high frequency. The shaft resonance suppression filter suppresses the vibration.                                                                                                                                                                                                                                                         | Section 7.1.3            |
| Adaptive filter II                        | Servo amplifier detects mechanical resonance and sets filter characteristics automatically to suppress mechanical vibration.                                                                                                                                                                                                                                                                                                                                               | Section 7.1.2            |
| Low-pass filter                           | Suppresses high-frequency resonance which occurs as servo system response is increased.                                                                                                                                                                                                                                                                                                                                                                                    | Section 7.1.4            |
| Machine analyzer function                 | Analyzes the frequency characteristic of the mechanical system by simply connecting a MR Configurator2 installed personal computer and servo amplifier. MR Configurator2 is necessary for this function.                                                                                                                                                                                                                                                                   |                          |
| Robust filter                             | This function provides better disturbance response in case low response level that load to motor inertia ratio is high for such as roll send axes.                                                                                                                                                                                                                                                                                                                         | [Pr. PE41]               |
| Slight vibration suppression control      | Suppresses vibration of $\pm 1$ pulse produced at a servo motor stop.                                                                                                                                                                                                                                                                                                                                                                                                      | [Pr. PB24]               |
| Auto tuning                               | Automatically adjusts the gain to optimum value if load applied to the servo motor shaft varies.                                                                                                                                                                                                                                                                                                                                                                           | Section 6.3              |
| Brake unit                                | Used when the regenerative option cannot provide enough regenerative power. Can be used for the 5 kW or more servo amplifier.                                                                                                                                                                                                                                                                                                                                              | Section 11.3             |
| Power regeneration converter              | Used when the regenerative option cannot provide enough regenerative power. Can be used for the 5 kW or more servo amplifier.                                                                                                                                                                                                                                                                                                                                              | Section 11.4             |
| Regenerative option                       | Used when the built-in regenerative resistor of the servo amplifier does not have sufficient regenerative capability for the regenerative power generated.                                                                                                                                                                                                                                                                                                                 | Section 11.2             |
| Alarm history clear                       | Alarm history is cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | [Pr. PC21]               |
| Output signal selection (device settings) | The output devices including ALM (Malfunction) and DB (Dynamic brake interlock) can be assigned to certain pins of the CN3 connector.                                                                                                                                                                                                                                                                                                                                      | [Pr. PD07] to [Pr. PD09] |
| Output signal (DO) forced output          | Output signal can be forced on/off independently of the servo status. Use this function for checking output signal wiring, etc.                                                                                                                                                                                                                                                                                                                                            | Section 4.5.1 (1) (d)    |
| Test operation mode                       | Jog operation, positioning operation, motor-less operation, DO forced output, and program operation can be used. MR Configurator2 is necessary for this function.                                                                                                                                                                                                                                                                                                          | Section 4.5              |
| Analog monitor output                     | Servo status is output in terms of voltage in real time.                                                                                                                                                                                                                                                                                                                                                                                                                   | [Pr. PC09], [Pr. PC10]   |
| MR Configurator2                          | Using a personal computer, you can perform the parameter setting, test operation, monitoring, and others.                                                                                                                                                                                                                                                                                                                                                                  | Section 11.7             |
| Linear servo system                       | Linear servo system can be configured using a linear servo motor and linear encoder.                                                                                                                                                                                                                                                                                                                                                                                       | Chapter 14               |
| Direct drive servo system                 | Direct drive servo system can be configured to drive a direct drive motor.                                                                                                                                                                                                                                                                                                                                                                                                 | Chapter 15               |

# 1. FUNCTIONS AND CONFIGURATION

| Function                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Detailed explanation                                                |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| Fully closed loop system                    | Fully closed loop system can be configured using the load-side encoder. This is used with servo amplifiers with software version A3 or later. Check the software version of the servo amplifier with MR Configurator2.                                                                                                                                                                                                                                                                                                                                                                                                 | Chapter 16                                                          |
| One-touch tuning                            | Gain adjustment is performed just by one click on a certain button on MR Configurator2.<br>MR Configurator2 is necessary for this function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Section 6.2                                                         |
| SEMI-F47 function (Note)                    | Enables to avoid triggering [AL. 10 Undervoltage] using the electrical energy charged in the capacitor in case that an instantaneous power failure occurs during operation. Use a 3-phase for the input power supply of the servo amplifier. Using a 1-phase 100 V AC/200 V AC for the input power supply will not comply with SEMI-F47 standard.                                                                                                                                                                                                                                                                      | [Pr. PA20]<br>[Pr. PF25]<br>Section 7.4                             |
| Tough drive function                        | This function makes the equipment continue operating even under the condition that an alarm occurs.<br>The tough drive function includes two types: the vibration tough drive and the instantaneous power failure tough drive.                                                                                                                                                                                                                                                                                                                                                                                         | Section 7.3                                                         |
| Drive recorder function                     | This function continuously monitors the servo status and records the status transition before and after an alarm for a fixed period of time. You can check the recorded data on the drive recorder window on MR Configurator2 by clicking the "Graph" button. However, the drive recorder will not operate on the following conditions.<br>1. You are using the graph function of MR Configurator2.<br>2. You are using the machine analyzer function.<br>3. [Pr. PF21] is set to "-1".<br>4. The controller is not connected (except the test operation mode).<br>5. An alarm related to the controller is occurring. | [Pr. PA23]                                                          |
| STO function                                | This function is a functional safety that complies with IEC/EN 61800-5-2. You can create a safety system for the equipment easily.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                     |
| Servo amplifier life diagnosis function     | You can check the cumulative energization time and the number of on/off times of the inrush relay. This function gives an indication of the replacement time for parts of the servo amplifier including a capacitor and a relay before they malfunction.<br>MR Configurator2 is necessary for this function.                                                                                                                                                                                                                                                                                                           |                                                                     |
| Power monitoring function                   | This function calculates the power running energy and the regenerative power from the data in the servo amplifier such as speed and current. For the SSCNET III/H system, MR Configurator2 can display the data, including the power consumption. Since the servo amplifier can send the data to a servo system controller, you can analyze the data and display the data on a display.                                                                                                                                                                                                                                |                                                                     |
| Machine diagnosis function                  | From the data in the servo amplifier, this function estimates the friction and vibrational component of the drive system in the equipment and recognizes an error in the machine parts, including a ball screw and bearing.<br>MR Configurator2 is necessary for this function.                                                                                                                                                                                                                                                                                                                                        |                                                                     |
| Master-slave operation function             | The function transmits a master axis torque to slave axes using driver communication and the torque as a command drives slave axes by torque control.<br>This is used with servo amplifiers with software version A8 or later. Check the software version of the servo amplifier with MR Configurator2.                                                                                                                                                                                                                                                                                                                | Section 17.2                                                        |
| Scale measurement function                  | The function transmits position information of a scale measurement encoder to the controller by connecting the scale measurement encoder in semi closed loop control. This is used with servo amplifiers with software version A8 or later. Check the software version of the servo amplifier with MR Configurator2.                                                                                                                                                                                                                                                                                                   | Section 17.3                                                        |
| J3 compatibility mode                       | This amplifier has "J3 compatibility mode" which compatible with the previous MR-J3-B series. Refer to section 17.1 for software versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Section 17.1                                                        |
| Continuous operation to torque control mode | This enables to smoothly switch the mode from position control mode/speed control mode to torque control mode without stopping. This also enables to decrease load to the machine and high quality molding without rapid changes in speed or torque. For details of the continuous operation to torque control mode, refer to the manuals for servo system controllers.                                                                                                                                                                                                                                                | [Pr. PB03]<br><br>Refer to the servo system controller manual used. |
| Lost motion compensation function           | This function improves the response delay occurred when the machine moving direction is reversed. This is used with servo amplifiers with software version B4 or later. Check the software version of the servo amplifier with MR Configurator2.                                                                                                                                                                                                                                                                                                                                                                       | Section 7.6                                                         |
| Super trace control                         | This function sets constant and uniform acceleration/deceleration droop pulses to almost 0. This is used with servo amplifiers with software version B4 or later. Check the software version of the servo amplifier with MR Configurator2.                                                                                                                                                                                                                                                                                                                                                                             | Section 7.7                                                         |

Note. For servo system controllers which are available with this, contact your local sales office.

# 1. FUNCTIONS AND CONFIGURATION

## 1.6 Model designation

### (1) Rating plate

The following shows an example of rating plate for explanation of each item.

### (2) Model

The following describes what each block of a model name indicates. Not all combinations of the symbols are available.

- Note 1. Indicates a servo amplifier of 11 kW to 22 kW that does not use a regenerative resistor as standard accessory. Refer to app. 11.2 for details.
2. Dynamic brake which is built in 7 kW or smaller servo amplifiers is removed. Refer to app. 11.1 for details.
3. Type with a specially-coated servo amplifier board (IEC 60721-3-3 Class 3C2). Refer to app. 11.3 for details.

| (13)                | Main circuit power connector (CNP1)<br>Connect the input power supply.                                                                                                                    |                                                          |
| (14)                | Rating plate                                                                                                                                                                              | Section 1.6                                              |
| (15)                | Control circuit power connector (CNP2)<br>Connect the control circuit power supply and regenerative option.                                                                               | Section 3.1<br>Section 3.3                               |
| (16)                | Servo motor power output connector (CNP3)<br>Connect the servo motor.                                                                                                                     |                                                          |
| (17)                | Charge lamp<br>When the main circuit is charged, this will light. While this lamp is lit, do not reconnect the cables.                                                                    |                                                          |
| (18)<br>(Note 1, 2) | External encoder connector (CN2L)<br>Refer to table 1.1 for connections of external encoders.                                                                                             | Section 3.4<br>"Linear Encoder Instruction Manual"       |
| (19)                | Optional unit connector 1 (CN7)<br>This is for connecting the optional unit. This connector is attached only on MR-J4-_B_-RJ.                                                             |                                                          |
| (20)                | Optional unit connector 2 (CN9)<br>This is for connecting the optional unit. This connector is attached only on MR-J4-_B_-RJ.                                                             |                                                          |

Note 1. This is for MR-J4-\_B\_-RJ servo amplifier. MR-J4-\_B\_ servo amplifier does not have CN2L connector.

2. "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

# 1. FUNCTIONS AND CONFIGURATION

## (b) MR-J4-350B(-RJ)

The broken line area is the same as MR-J4-200B(-RJ) or less.

# 1. FUNCTIONS AND CONFIGURATION

(c) MR-J4-500B(-RJ)

## POINT

- The servo amplifier is shown with the front cover open. The front cover cannot be removed.

The broken line area is the same as MR-J4-200B(-RJ) or less.

| No. | Name/Application                                                                                                                                          | Detailed explanation       |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| (1) | Control circuit terminal block (TE2)<br>Used to connect the control circuit power supply.                                                                 | Section 3.1                |
| (2) | Main circuit terminal block (TE1)<br>Connect the input power supply.                                                                                      | Section 3.3                |
| (3) | Battery holder<br>Install the battery for absolute position data backup.                                                                                  | Section 12.2               |

| (18)<br>(Note 1, 2) | External encoder connector (CN2L)<br>Used to connect the external encoder. Refer to table 1.1 for the compatible external encoders.                           |                                                          |
| (19)                | Optional unit connector 1 (CN7)<br>This is for connecting the optional unit. This connector is attached only on MR-J4-_B_-RJ.                                 |                                                          |
| (20)                | Optional unit connector 2 (CN9)<br>This is for connecting the optional unit. This connector is attached only on MR-J4-_B_-RJ.                                 |                                                          |

Note 1. This is for MR-J4-\_B4\_-RJ servo amplifier. MR-J4-\_B4\_ servo amplifier does not have CN2L connector.

2. "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

Note 1. This is for MR-J4-\_B1-RJ servo amplifier. MR-J4-\_B1 servo amplifier does not have CN2L connector.

2. "External encoder" is a term for linear encoder used in the linear servo system, load-side encoder used in the fully closed loop system, and scale measurement encoder used with the scale measurement function in this manual.

# 1. FUNCTIONS AND CONFIGURATION

## 1.7.2 Removal and reinstallation of the front cover

### WARNING

● Before removing or installing the front cover, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.

The following shows how to remove and reinstall the front cover of MR-J4-700B(-RJ) to MR-J4-22KB(-RJ) and MR-J4-500B4(-RJ) to MR-J4-22KB4(-RJ).

The diagram is for MR-J4-700B.

#### (1) Removal of the front cover

1) Hold the ends of lower side of the front cover with both hands.

2) Pull up the cover, supporting at point A).

3) Pull out the front cover to remove.

# 1. FUNCTIONS AND CONFIGURATION

---

## (2) Reinstallation of the front cover

1) Insert the front cover setting tabs into the sockets of servo amplifier (2 places).

2) Push down the cover, supporting at point A).

3) Press the cover against the terminal box until the installing knobs click.

# 1. FUNCTIONS AND CONFIGURATION

---

## 1.8 Configuration including peripheral equipment

### CAUTION

- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.

| POINT                                                                                            |
|--------------------------------------------------------------------------------------------------|
| ● Equipment other than the servo amplifier and servo motor are optional or recommended products. |
| ● When using the MR-J4-_B-RJ servo amplifier with the DC power supply input, refer to app. 15.   |

# 1. FUNCTIONS AND CONFIGURATION

(1) 200 V class

(a) MR-J4-200B(-RJ) or less

The diagram is for MR-J4-20B-RJ.

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector. When using MR-J4-\_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(b) MR-J4-350B(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector. When using MR-J4-\_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(c) MR-J4-500B(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector. When using MR-J4-\_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(d) MR-J4-700B(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector. When using MR-J4-\_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(e) MR-J4-11KB(-RJ)/MR-J4-15KB(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4- \_B-RJ servo amplifier. MR-J4- \_B servo amplifier does not have CN2L connector. When using MR-J4- \_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

## (f) MR-J4-22KB(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specifications.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B-RJ servo amplifier. MR-J4-\_B servo amplifier does not have CN2L connector. When using MR-J4-\_B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(2) 400 V class

(a) MR-J4-200B4(-RJ) or less

The diagram is for MR-J4-60B4-RJ and MR-J4-100B4-RJ.

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specification.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(b) MR-J4-350B4(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specification.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(c) MR-J4-500B4(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specification.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(d) MR-J4-700B4(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specification.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

(e) MR-J4-11K4B(-RJ)/MR-J4-15K4B(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
2. Refer to section 1.3 for the power supply specification.
3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

## (f) MR-J4-22K4B(-RJ)

- Note 1. The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- Note 2. Refer to section 1.3 for the power supply specification.
- Note 3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 4. This is for MR-J4-\_B4-RJ servo amplifier. MR-J4-\_B4 servo amplifier does not have CN2L connector. When using MR-J4-\_B4-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to Table 1.1 and "Linear Encoder Instruction Manual" for the compatible external encoders.
- Note 5. When using the regenerative option, refer to section 11.2.

# 1. FUNCTIONS AND CONFIGURATION

## (3) 100 V class

The diagram is for MR-J4-20B1-RJ.

- Note
1. The power factor improving DC reactor cannot be used.
  2. For power supply specifications, refer to section 1.3.
  3. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
  4. This is for MR-J4-\_B1-RJ servo amplifier. MR-J4-\_B1 servo amplifier does not have CN2L connector. Refer to Table 1.1 and Linear Encoder Instruction Manual for the compatible external encoders.
  5. Always connect between P+ and D terminals. When using the regenerative option, refer to section 11.2.

## 2. INSTALLATION

### 2. INSTALLATION

 **WARNING** ● To prevent electric shock, ground each equipment securely.

 **CAUTION**

- Stacking in excess of the specified number of product packages is not allowed.
- Do not hold the front cover, cables, or connectors when carrying the servo amplifier. Otherwise, it may drop.
- Install the equipment on incombustible material. Installing it directly or close to combustibles will lead to a fire.
- Install the servo amplifier and the servo motor in a load-bearing place in accordance with the Instruction Manual.
- Do not get on or put heavy load on the product. Otherwise, it may cause injury.
- Use the equipment within the specified environment. For the environment, refer to section 1.3.
- Provide an adequate protection to prevent screws and other conductive matter, oil and other combustible matter from entering the servo amplifier.
- Do not block the intake and exhaust areas of the servo amplifier. Otherwise, it may cause a malfunction.
- Do not drop or apply heavy impact on the servo amplifiers and the servo motors. Otherwise, injury, malfunction, etc. may occur.
- Do not install or operate the servo amplifier which have been damaged or have any parts missing.
- When the product has been stored for an extended period of time, contact your local sales office.
- When handling the servo amplifier, be careful about the edged parts such as corners of the servo amplifier.
- The servo amplifier must be installed in the metal cabinet.
- When fumigants that contain halogen materials such as fluorine, chlorine, bromine, and iodine are used for disinfecting and protecting wooden packaging from insects, they cause malfunction when entering our products. Please take necessary precautions to ensure that remaining materials from fumigant do not enter our products, or treat packaging with methods other than fumigation (heat method). Additionally, disinfect and protect wood from insects before packing products.

**POINT**

- When pulling out CNP1, CNP2, and CNP3 connectors of 100 V class/600 W or lower 200 V class servo amplifier, pull out CN3 and CN8 connectors beforehand.

## 2. INSTALLATION

### 2.1 Installation direction and clearances

#### CAUTION

- The equipment must be installed in the specified direction. Otherwise, it may cause a malfunction.
- Leave specified clearances between the servo amplifier and the cabinet walls or other equipment. Otherwise, it may cause a malfunction.

#### (1) Installation clearances of the servo amplifier

##### (a) Installation of one servo amplifier

Note 1. For 11 kW to 22 kW servo amplifiers, the clearance between the bottom and ground will be 120 mm or more.

Note 2. When mounting MR-J4-500B(-RJ), maintain a minimum clearance of 25 mm on the left side.

## 2. INSTALLATION

### (b) Installation of two or more servo amplifiers

| POINT                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>● Close mounting is possible depending on the capacity of the servo amplifier. Refer to section 1.3 for availability of close mounting.</li> <li>● When closely mounting multiple servo amplifiers, the servo amplifier on the right must have a larger depth than that on the left. Otherwise, the CNP1, CNP2, and CNP3 connectors cannot be removed.</li> </ul> |

Leave a large clearance between the top of the servo amplifier and the cabinet walls, and install a cooling fan to prevent the internal temperature of the cabinet from exceeding the environment. When mounting the servo amplifiers closely, leave a clearance of 1 mm between the adjacent servo amplifiers in consideration of mounting tolerances. In this case, keep the ambient temperature within 0 °C to 45 °C or use the servo amplifier with 75% or less of the effective load ratio.

- Note 1. For 11 kW to 22 kW servo amplifiers, the clearance between the bottom and ground will be 120 mm or more.
- Note 2. When mounting MR-J4-500B(-RJ), maintain a minimum clearance of 25 mm between the MR-J4-500B(-RJ) and a servo amplifier mounted on the left side.

### (2) Others

When using heat generating equipment such as the regenerative option, install them with full consideration of heat generation so that the servo amplifier is not affected. Install the servo amplifier on a perpendicular wall in the correct vertical direction.

## 2. INSTALLATION

---

### 2.2 Keeping out of foreign materials

- (1) When drilling in the cabinet, prevent drill chips and wire fragments from entering the servo amplifier.
- (2) Prevent oil, water, metallic dust, etc. from entering the servo amplifier through openings in the cabinet or a cooling fan installed on the ceiling.
- (3) When installing the cabinet in a place where toxic gas, dirt and dust exist, conduct an air purge (force clean air into the cabinet from outside to make the internal pressure higher than the external pressure) to prevent such materials from entering the cabinet.

### 2.3 Encoder cable stress

- (1) The way of clamping the cable must be fully examined so that bending stress and cable's own weight stress are not applied to the cable connection.
- (2) For use in any application where the servo motor moves, fix the cables (encoder, power supply, and brake) with having some slack from the connector connection part of the servo motor to avoid putting stress on the connector connection part. Use the optional encoder cable within the bending life range. Use the power supply and brake wiring cables within the bending life of the cables.
- (3) Avoid any probability that the cable insulator might be cut by sharp chips, rubbed by a machine corner or stamped by workers or vehicles.
- (4) For installation on a machine where the servo motor moves, the bending radius should be made as large as possible. Refer to section 10.4 for the bending life.

### 2.4 SSCNET III cable laying

SSCNET III cable is made from optical fiber. If optical fiber is added a power such as a major shock, lateral pressure, haul, sudden bending or twist, its inside distorts or breaks, and optical transmission will not be available. Especially, as optical fiber for MR-J3BUS\_M/MR-J3BUS\_M-A is made of synthetic resin, it melts down if being left near the fire or high temperature. Therefore, do not make it touched the part, which can become hot, such as heat sink or regenerative option of servo amplifier.

Read described item in this section carefully and handle it with caution.

#### (1) Minimum bend radius

Make sure to lay the cable with greater radius than the minimum bend radius. Do not press the cable to edges of equipment or others. For SSCNET III cable, the appropriate length should be selected with due consideration for the dimensions and arrangement of servo amplifier. When closing the door of cabinet, pay careful attention for avoiding the case that SSCNET III cable is hold down by the door and the cable bend becomes smaller than the minimum bend radius. For the minimum bend radius, refer to section 11.1.3.

## 2. INSTALLATION

### (2) Prohibition of vinyl tape use

Migrating plasticizer is used for vinyl tape. Keep the MR-J3BUS\_M, and MR-J3BUS\_M-A cables away from vinyl tape because the optical characteristic may be affected.

| SSCNET III cable | Cord | Cable |
|------------------|------|-------|
| MR-J3BUS_M       | △    | △     |
| MR-J3BUS_M-A     | △    | △     |
| MR-J3BUS_M-B     | ○    | ○     |

△: Phthalate ester plasticizer such as DBP and DOP may affect optical characteristic of cable.

○: Cord and cable are not basically affected by plasticizer.

### (3) Precautions for migrating plasticizer added materials

Generally, soft polyvinyl chloride (PVC), polyethylene resin (PE) and fluorine resin contain non-migrating plasticizer and they do not affect the optical characteristic of SSCNET III cable. However, some wire sheaths and cable ties, which contain migrating plasticizer (phthalate ester), may affect MR-J3BUS\_M and MR-J3BUS\_M-A cables (plastic).

In addition, MR-J3BUS\_M-B cable (silica glass) is not affected by plasticizer.

A chemical substance may affect its optical characteristic. Therefore, previously check that the cable is not affected by the environment.

### (4) Bundle fixing

Fix the cable at the closest part to the connector with bundle material in order to prevent SSCNET III cable from putting its own weight on CN1A/CN1B connector of servo amplifier. Optical cord should be given loose slack to avoid from becoming smaller than the minimum bend radius, and it should not be twisted.

When bundling the cable, fix and hold it in position by using cushioning such as sponge or rubber which does not contain migratable plasticizers.

If adhesive tape for bundling the cable is used, fire resistant acetate cloth adhesive tape 570F (Teraoka Seisakusho Co., Ltd) is recommended.

## 2. INSTALLATION

---

### (5) Tension

If tension is added on optical cable, the increase of transmission loss occurs because of external force which concentrates on the fixing part of optical fiber or the connecting part of optical connector. Doing so may cause the breakage of the optical fiber or damage of the optical connector. For cable laying, handle without putting forced tension. For the tension strength, refer to section 11.1.3.

### (6) Lateral pressure

If lateral pressure is added on optical cable, the optical cable itself distorts, internal optical fiber gets stressed, and then transmission loss will increase. Doing so may cause the breakage of the optical cable. As the same condition also occurs at cable laying, do not tighten up optical cable with a thing such as nylon band (cable tie).

Do not trample it down or tuck it down with the door of cabinet or others.

### (7) Twisting

If optical fiber is twisted, it will become the same stress added condition as when local lateral pressure or bend is added. Consequently, transmission loss increases, and the breakage of optical fiber may occur.

### (8) Disposal

When incinerating optical cable (cord) used for SSCNET III, hydrogen fluoride gas or hydrogen chloride gas which is corrosive and harmful may be generated. For disposal of optical fiber, request for specialized industrial waste disposal services who has incineration facility for disposing hydrogen fluoride gas or hydrogen chloride gas.

## 2.5 Inspection items

### WARNING

- Before starting maintenance and/or inspection, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- To avoid an electric shock, only qualified personnel should attempt inspections. For repair and parts replacement, contact your local sales office.

### CAUTION

- Do not perform insulation resistance test on the servo amplifier. Otherwise, it may cause a malfunction.
- Do not disassemble and/or repair the equipment on customer side.

It is recommended that the following points periodically be checked.

- (1) Check for loose terminal block screws. Retighten any loose screws.
- (2) Check the cables and the like for scratches or cracks. Inspect them periodically according to operating conditions especially when the servo motor is movable.
- (3) Check that the connector is securely connected to the servo amplifier.
- (4) Check that the wires are not coming out from the connector.

## 2. INSTALLATION

---

- (5) Check for dust accumulation on the servo amplifier.
- (6) Check for unusual noise generated from the servo amplifier.
- (7) Make sure that the emergency stop circuit operates properly such that an operation can be stopped immediately and a power is shut off by the emergency stop switch.

### 2.6 Parts having service life

Service life of the following parts is listed below. However, the service life varies depending on operation and environment. If any fault is found in the parts, they must be replaced immediately regardless of their service life. For parts replacement, please contact your local sales office.

| Part name                 | Life guideline                                                                                                                                           |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smoothing capacitor       | 10 years                                                                                                                                                 |
| Relay                     | Number of power-on, forced stop by EM1 (Forced stop 1), and controller forced stop times: 100,000 times<br>Number of on and off for STO: 1,000,000 times |
| Cooling fan               | 10,000 hours to 30,000 hours (2 years to 3 years)                                                                                                        |
| Absolute position battery | Refer to section 12.2.                                                                                                                                   |

#### (1) Smoothing capacitor

The characteristic of smoothing capacitor is deteriorated due to ripple currents, etc. The life of the capacitor greatly depends on ambient temperature and operating conditions. The capacitor will reach the end of its life in 10 years of continuous operation in air-conditioned environment (ambient temperature of 40 °C or less).

#### (2) Relays

Contact faults will occur due to contact wear arisen from switching currents. Relays reach the end of their life when the power has been turned on, forced stop by EM1 (Forced stop 1) has occurred, and controller forced stop has occurred 100,000 times in total, or when the STO has been turned on and off 1,000,000 times while the servo motor is stopped under servo-off state. However, the life of relays may depend on the power supply capacity.

#### (3) Servo amplifier cooling fan

The cooling fan bearings reach the end of their life in 10,000 hours to 30,000 hours. Normally, therefore, the cooling fan must be replaced in a few years of continuous operation as a guideline. If unusual noise or vibration is found during inspection, the cooling fan must also be replaced.

The life indicates under the yearly average ambient temperature of 40 °C, free from corrosive gas, flammable gas, oil mist, dust and dirt.

## 2. INSTALLATION

---

### 2.7 Restrictions when using this product at altitude exceeding 1000 m and up to 2000 m above sea level

#### (1) Effective load ratio and regenerative load ratio

As heat dissipation effects decrease in proportion to the decrease in air density, use the product within the effective load ratio and regenerative load ratio shown in the following figure.

When closely mounting the servo amplifiers, operate them at the ambient temperature of 0 °C to 45 °C or at 75% or smaller effective load ratio. (Refer to section 2.1.)

#### (2) Input voltage

Generally, a withstand voltage decreases as increasing altitude; however, there is no restriction on the withstand voltage. Use in the same manner as in 1000 m or less. (Refer to section 1.3.)

#### (3) Parts having service life

##### (a) Smoothing capacitor

The capacitor will reach the end of its life in 10 years of continuous operation in air-conditioned environment (ambient temperature of 30 °C or less).

##### (b) Relay

There is no restriction. Use in the same manner as in 1000 m or less. (Refer to section 2.6.)

##### (c) Servo amplifier cooling fan

There is no restriction. Use in the same manner as in 1000 m or less. (Refer to section 2.6.)

### 3. SIGNALS AND WIRING

#### 3. SIGNALS AND WIRING

#### WARNING

- Any person who is involved in wiring should be fully competent to do the work.
- Before wiring, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.
- Ground the servo amplifier and servo motor securely.
- Do not attempt to wire the servo amplifier and servo motor until they have been installed. Otherwise, it may cause an electric shock.
- The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.
- To avoid an electric shock, insulate the connections of the power supply terminals.

#### CAUTION

- Wire the equipment correctly and securely. Otherwise, the servo motor may operate unexpectedly, resulting in injury.
- Connect cables to the correct terminals. Otherwise, a burst, damage, etc. may occur.
- Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc. may occur.
- The surge absorbing diode installed to the DC relay for control output should be fitted in the specified direction. Otherwise, the emergency stop and other protective circuits may not operate.

- Use a noise filter, etc. to minimize the influence of electromagnetic interference. Electromagnetic interference may be given to the electronic equipment used near the servo amplifier.
- Do not install a power capacitor, surge killer or radio noise filter (optional FR-BIF(-H)) with the power line of the servo motor.
- When using the regenerative resistor, switch power off with the alarm signal. Otherwise, a transistor fault or the like may overheat the regenerative resistor, causing a fire.
- Do not modify the equipment.

### 3. SIGNALS AND WIRING

- Connect the servo amplifier power output (U/V/W) to the servo motor power input (U/V/W) directly. Do not let a magnetic contactor, etc. intervene. Otherwise, it may cause a malfunction.

CAUTION

- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.

#### POINT

- When you use a linear servo motor, replace the following words in the left to the words in the right.

|                             |                              |
|-----------------------------|------------------------------|
| Load to motor inertia ratio | → Load mass                  |
| Torque                      | → Thrust                     |
| (Servo motor) speed         | → (Linear servo motor) speed |

### 3. SIGNALS AND WIRING

#### 3.1 Input power supply circuit

#### CAUTION

- Always connect a magnetic contactor between the power supply and the main circuit power supply (L1/L2/L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause a fire when the servo amplifier malfunctions.
- Use ALM (Malfunction) to switch main circuit power supply off. Not doing so may cause a fire when a regenerative transistor malfunctions or the like may overheat the regenerative resistor.
- Check the servo amplifier model, and then input proper voltage to the servo amplifier power supply. If input voltage exceeds the upper limit, the servo amplifier will break down.
- The servo amplifier has a built-in surge absorber (varistor) to reduce exogenous noise and to suppress lightning surge. Exogenous noise or lightning surge deteriorates the varistor characteristics, and the varistor may be damaged. To prevent a fire, use a molded-case circuit breaker or fuse for input power supply.
- Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- The N- terminal is not a neutral point of the power supply. Incorrect wiring will cause a burst, damage, etc.

#### POINT

- Even if alarm has occurred, do not switch off the control circuit power supply. When the control circuit power supply has been switched off, optical module does not operate, and optical transmission of SSCNET III/H communication is interrupted. Therefore, the next axis servo amplifier displays "AA" at the indicator and turns into base circuit shut-off. The servo motor stops with starting dynamic brake.
- EM2 has the same function as EM1 in the torque control mode.
- Connect the 1-phase 200 V AC to 240 V AC power supply to L1 and L3. One of the connecting destinations is different from MR-J3 Series Servo Amplifier's. When using MR-J4 as a replacement for MR-J3, be careful not to connect the power to L2.
- When using the MR-J4-\_B-RJ servo amplifier with the DC power supply input, refer to app. 15.

Configure the wiring so that the main circuit power supply is shut off and the servo-on command turned off after deceleration to a stop due to an alarm occurring, an enabled servo forced stop, or an enabled controller forced stop. A molded-case circuit breaker (MCCB) must be used with the input cables of the main circuit power supply.

3 - 4

### 3. SIGNALS AND WIRING

(2) Using 1-phase 200 V AC to 240 V AC power supply for MR-J4-10B(-RJ) to MR-J4-200B(-RJ)

#### POINT

- Connect the 1-phase 200 V AC to 240 V AC power supply to L1 and L3. One of the connecting destinations is different from MR-J3 Series Servo Amplifier's. When using MR-J4 as a replacement for MR-J3, be careful not to connect the power to L2.

- Note
1. Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Refer to section 11.11 for details. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
  2. Always connect between P+ and D terminals (factory-wired). When using the regenerative option, refer to section 11.2.
  3. For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
  4. If ALM (Malfunction) output is disabled with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
  5. This diagram shows sink I/O interface. For source I/O interface, refer to section 3.8.3.
  6. For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
  7. Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
  8. Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
  9. When not using the STO function, attach the short-circuit connector came with a servo amplifier.
  10. When wires used for L11 and L21 are thinner than wires used for L1, and L3, use a molded-case circuit breaker. (Refer to section 11.10.)
  11. Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
  12. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

- Note 5. This diagram shows sink I/O interface. For source I/O interface, refer to section 3.8.3.
- Note 6. For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- Note 7. Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- Note 8. Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- Note 9. When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- Note 10. When wires used for L11 and L21 are thinner than wires used for L1 and L2, use a molded-case circuit breaker. (Refer to section 11.10.)
- Note 11. Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- Note 12. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

### 3. SIGNALS AND WIRING

#### 3.2 I/O signal connection example

##### POINT

- EM2 has the same function as EM1 in the torque control mode.

##### 3.2.1 For sink I/O interface

### 3. SIGNALS AND WIRING

- Note
1. To prevent an electric shock, always connect the protective earth (PE) terminal (marked  $\oplus$ ) of the servo amplifier to the protective earth (PE) of the cabinet.
  2. Connect the diode in the correct direction. If it is connected reversely, the servo amplifier will malfunction and will not output signals, disabling EM2 (Forced stop 2) and other protective circuits.
  3. If the controller does not have forced stop function, always install the forced stop 2 switch (normally closed contact).
  4. When starting operation, always turn on EM2 (Forced stop 2). (Normally closed contact)
  5. Use SW1DNC-MRC2-\_. (Refer to section 11.7.)
  6. Use SSCNET III cables listed in the following table.

| Cable                          | Cable model  | Cable length  |
|--------------------------------|--------------|---------------|
| Standard cord inside cabinet   | MR-J3BUS_M   | 0.15 m to 3 m |
| Standard cable outside cabinet | MR-J3BUS_M-A | 5 m to 20 m   |
| Long-distance cable            | MR-J3BUS_M-B | 30 m to 50 m  |

7. The wiring after the second servo amplifier is omitted.
8. Up to 64 axes of servo amplifiers can be connected. The number of connectable axes depends on the controller you use. Refer to section 4.3.1 for setting of axis selection.
9. Make sure to cap the unused CN1B connector.
10. Supply 24 V DC  $\pm$  10% for interfaces from outside. Set the total current capacity to 300 mA. 300 mA is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points. Refer to section 3.8.2 (1) that gives the current value necessary for the interface. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
11. ALM (Malfunction) turns on in normal alarm-free condition. (Normally closed contact)
12. The pins with the same signal name are connected in the servo amplifier.
13. You can change devices of these pins with [Pr. PD07], [Pr. PD08], and [Pr. PD09].
14. Devices can be assigned for these signals with controller setting. For devices that can be assigned, refer to the controller instruction manual. The following devices can be assigned for R\_MTCPU, Q17\_DSCPU, RD77MS\_ and QD77MS\_.  
 FLS: Upper stroke limit  
 RLS: Lower stroke limit  
 DOG: Proximity dog
15. Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
16. When not using the STO function, attach the short-circuit connector came with a servo amplifier.
17. When you use a linear servo motor or direct drive motor, use MBR (Electromagnetic brake interlock) for an external brake mechanism.

### 3. SIGNALS AND WIRING

#### 3.2.2 For source I/O interface

| POINT                                |
|--------------------------------------|
| ● For notes, refer to section 3.2.1. |

### 3. SIGNALS AND WIRING

#### 3.3 Explanation of power supply system

##### 3.3.1 Signal explanations

###### POINT

- For the layout of connector and terminal block, refer to chapter 9 DIMENSIONS.
- When using the MR-J4-\_B-RJ servo amplifier with the DC power supply input, refer to app. 15.

| Symbol   | Connection target<br>(application) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                             |                                      |                                       |                                       |                          |                                           |          |  |  |  |                                           |       |  |  |  |                                           |  |  |          |  |                                           |  |  |  |       |

| U/V/W   | Servo motor power input                                                           | Connect the servo amplifier power output (U/V/W) to the servo motor power input (U/V/W) directly. Do not let a magnetic contactor, etc. intervene. Otherwise, it may cause a malfunction. |                                      |                                        |                             |
| N-      | Power regeneration converter<br>Power regeneration common converter<br>Brake unit | This terminal is used for a power regeneration converter, power regeneration common converter and brake unit.<br>Refer to section 11.3 to 11.5 for details.                               |                                      |                                        |                             |
| ⊕       | Protective earth (PE)                                                             | Connect it to the grounding terminal of the servo motor and to the protective earth (PE) of the cabinet for grounding.                                                                    |                                      |                                        |                             |

#### 3.3.2 Power-on sequence

|       |                                                      |
|-------|------------------------------------------------------|
| POINT |                                                      |
| ●     | The output signal, etc. may be unstable at power-on. |

##### (1) Power-on procedure

- 1) Always wire the power supply as shown in above section 3.1 using the magnetic contactor with the main circuit power supply (L1/L2/L3). Configure up an external sequence to switch off the magnetic contactor as soon as an alarm occurs.
- 2) Switch on the control circuit power supply (L11/L21) simultaneously with the main circuit power supply or before switching on the main circuit power supply. If the control circuit power supply is turned on with the main circuit power supply off, and then the servo-on command is transmitted, [AL. E9 Main circuit off warning] will occur. Turning on the main circuit power supply stops the warning and starts the normal operation.
- 3) The servo amplifier receives the servo-on command within 3 s to 4 s after the main circuit power supply is switched on.  
(Refer to (2) in this section.)

### 3. SIGNALS AND WIRING

#### (2) Timing chart

- Note 1. This range will be "5 s to 6 s" for the linear servo system and fully closed loop system.
- Note 2. The time will be longer during the magnetic pole detection of a linear servo motor and direct drive motor.

#### 3.3.3 Wiring CNP1, CNP2, and CNP3

| POINT                                                                                |
|--------------------------------------------------------------------------------------|
| ● For the wire sizes used for wiring, refer to section 11.9.                         |
| ● When wiring, remove the power connectors from the servo amplifier.                 |
| ● Insert only one wire or ferrule to each wire insertion hole.                       |
| ● MR-J4-500B(-RJ) or more and MR-J4-500B4(-RJ) or more do not have these connectors. |

Use the servo amplifier power connector for wiring CNP1, CNP2, and CNP3.

#### (2) Cable connection procedure

##### (a) Fabrication on cable insulator

Refer to table 3.1 to 3.4 for stripped length of cable insulator. The appropriate stripped length of cables depends on their type, etc. Set the length considering their status.

Twist strands lightly and straighten them as follows.

### 3. SIGNALS AND WIRING

You can also use a ferrule to connect with the connectors. When using a ferrule, select a ferrule and crimping tool listed in the table below.

| Servo amplifier                        | Wire size | Ferrule model (Phoenix Contact) |                   | Crimping tool<br>(Phoenix Contact) |
|----------------------------------------|-----------|---------------------------------|-------------------|------------------------------------|

#### (b) Inserting wire

Insert only one wire or ferrule to each wire insertion hole.

Insert the open tool as follows and push it down to open the spring. While the open tool is pushed down, insert the stripped wire into the wire insertion hole. Check the wire insertion depth, and make sure that the cable insulator will not be caught by the spring and that the conductive part of the stripped wire will not be exposed.

Release the open tool to fix the wire. Pull the wire lightly to confirm that the wire is surely connected. In addition, make sure that no conductor wire sticks out of the connector.

The following shows a connection example of the CNP3 connector for MR-J4-200B(-RJ) and MR-J4-350B(-RJ).

### 3. SIGNALS AND WIRING

---

#### 3.4 Connectors and pin assignment

### 3. SIGNALS AND WIRING

The servo amplifier front view shown is that of the MR-J4-20B or less. Refer to chapter 9 DIMENSIONS for the appearances and connector layouts of the other servo amplifiers.

The frames of the CN2 and CN3 connectors are connected to the protective earth terminal in the servo amplifier.

Note 1. The MR-J4-\_B\_ servo amplifiers have CN2L connectors. This CN2L is a connector of 3M.

When using any other connector, refer to each servo motor instruction manual.

2. Refer to table 1.1 and "Linear Encoder Instruction Manual" for connections of external encoders.

### 3. SIGNALS AND WIRING

#### 3.5 Signal (device) explanations

For the I/O interfaces (symbols in I/O division column in the table), refer to section 3.8.2.

The pin numbers in the connector pin No. column are those in the initial status.

##### 3.5.1 Input device

| Device                                                                                              | Symbol                | Connector pin No. | Function and application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | I/O division |                       |                                                                                       |                                                                                       |                     |                   |                |        |     |                                                                                       |                                                                                       |        |     |                                                                                     |                                                                                     |        |                       |  |                                                                                       |        |                       |  |                                                                                     |

### 3. SIGNALS AND WIRING

#### 3.5.2 Output device

##### (1) Output device pin

The following shows the output device pins and parameters for assigning devices.

| Connector pin No. | Parameter  | Initial device | I/O division |
|-------------------|------------|----------------|--------------|
| CN3-13            | [Pr. PD07] | MBR            | DO-1         |
| CN3-9             | [Pr. PD08] | INP            |              |
| CN3-15            | [Pr. PD09] | ALM            |              |

##### (2) Output device explanations

| Device                          | Symbol | Function and application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Electromagnetic brake interlock | MBR    | When using the device, set operation delay time of the electromagnetic brake in [Pr. PC02]. When a servo-off status or alarm occurs, MBR will turn off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Malfunction                     | ALM    | When the protective circuit is activated to shut off the base circuit, ALM will turn off. When an alarm does not occur, ALM will turn on after 2.5 s to 3.5 s after power-on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| In-position                     | INP    | When the number of droop pulses is in the in-position range, INP will turn on. The in-position range can be changed using [Pr. PA10]. When the in-position range is increased, INP may be on during low-speed rotation.<br>The device cannot be used in the speed control mode, torque control mode, and for continuous operation to torque control mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Dynamic brake interlock         | DB     | When using the signal, enable it by the setting of [Pr. PD07] to [Pr. PD09]. DB turns off when the dynamic brake needs to operate. When using the external dynamic brake on the servo amplifier of 11 kW or more, this device is required. (Refer to section 11.17.)<br>For the servo amplifier of 7 kW or less, it is not necessary to use this device.<br>The external dynamic brake cannot be used with 11 kW or more servo amplifier for compliance with SEMI-F47 standard. Do not assign DB (Dynamic brake interlock) in [Pr. PD07] to [Pr. PD09]. Failure to do so will cause the servo amplifier to become servo-off when an instantaneous power failure occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Ready                           | RD     | Enabling servo-on to make the servo amplifier ready to operate will turn on RD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Speed reached                   | SA     | SA will turn off during servo-off. When the servo motor speed reaches the following range, SA will turn on. Set speed $\pm ((\text{Set speed} \times 0.05) + 20)$ r/min<br>When the preset speed is 20 r/min or less, SA always turns on.<br>The device cannot be used in the position control mode and torque control mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Limiting speed                  | VLC    | When the speed reaches the speed limit value in the torque control mode, VLC will turn on. When the servo is off, TLC will be turned off.<br>The device cannot be used in the position control mode and speed control mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Zero speed detection            | ZSP    | <p>ZSP turns on when the servo motor speed is zero speed (50 r/min) or less. Zero speed can be changed with [Pr. PC07].</p> <p>The graph illustrates the ZSP (Zero speed detection) signal's behavior relative to servo motor speed. The speed curve oscillates between 70 r/min and -70 r/min. The ZSP signal is ON when the speed is at or below 50 r/min and OFF when the speed is at or above 70 r/min. The hysteresis width is 20 r/min. The graph is divided into four regions: 1) Forward rotation, OFF level 70 r/min, ON level 50 r/min; 2) Forward rotation, ON level 50 r/min, OFF level 70 r/min; 3) Reverse rotation, ON level -50 r/min, OFF level -70 r/min; 4) Reverse rotation, OFF level -70 r/min, ON level -50 r/min.</p> <p>ZSP will turn on when the servo motor is decelerated to 50 r/min (at 1)), and will turn off when the servo motor is accelerated to 70 r/min again (at 2)).<br/>ZSP will turn on when the servo motor is decelerated again to 50 r/min (at 3)), and will turn off when the servo motor speed has reached -70 r/min (at 4)).<br/>The range from the point when the servo motor speed has reached on level, and ZSP turns on, to the point when it is accelerated again and has reached off level is called hysteresis width.<br/>Hysteresis width is 20 r/min for this servo amplifier.<br/>When you use a linear servo motor, [r/min] explained above will be [mm/s].</p> |

### 3. SIGNALS AND WIRING

| Device                           | Symbol | Function and application                                                                                                                                                                                  |
|----------------------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limiting torque                  | TLC    | When the torque reaches the torque limit value during torque generation, TLC will turn on. When the servo is off, TLC will be turned off.<br>This device cannot be used in the torque control mode.       |
| Warning                          | WNG    | When warning has occurred, WNG turns on. When a warning is not occurring, WNG will turn off in 2.5 s to 3.5 s after power-on.                                                                             |
| Battery warning                  | BWNG   | BWNG turns on when [AL. 92 Battery cable disconnection warning] or [AL. 9F Battery warning] has occurred. When the battery warning is not occurring, BWNG will turn off in 2.5 s to 3.5 s after power-on. |
| Variable gain selection          | CDPS   | CDPS will turn on during variable gain.                                                                                                                                                                   |
| Absolute position undetermined   | ABSV   | ABSV turns on when the absolute position is undetermined.<br>The device cannot be used in the speed control mode and torque control mode.                                                                 |
| During tough drive               | MTTR   | When a tough drive is enabled in [Pr. PA20], activating the instantaneous power failure tough drive will turn on MTTR.                                                                                    |
| During fully closed loop control | CLDS   | CLDS turns on during fully closed loop control.                                                                                                                                                           |

#### 3.5.3 Output signal

| Signal name                                      | Symbol    | Connector pin No. | Function and application                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|-----------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encoder A-phase pulse (differential line driver) | LA<br>LAR | CN3-6<br>CN3-16   | These devices output pulses of encoder output set in [Pr. PA15] and [Pr. PA16] in the differential line driver type.<br>In CCW rotation of the servo motor, the encoder B-phase pulse lags the encoder A-phase pulse by a phase angle of $\pi/2$ .<br>The relation between rotation direction and phase difference of the A-phase and B-phase pulses can be changed with [Pr. PC03].<br>Output pulse specification, dividing ratio setting, and electronic gear setting can be selected. |
| Encoder B-phase pulse (differential line driver) | LB<br>LBR | CN3-7<br>CN3-17   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Encoder Z-phase pulse (differential line driver) | LZ<br>LZR | CN3-8<br>CN3-18   | The encoder zero-point signal is output in the differential line driver type. One pulse is output per servo motor revolution. This turns on when the zero-point position is reached. (negative logic)<br>The minimum pulse width is about 400 $\mu$ s. For home position return using this pulse, set the creep speed to 100 r/min or less.                                                                                                                                              |
| Analog monitor 1                                 | MO1       | CN3-4             | This is used to output the data set in [Pr. PC09] to between MO1 and LG in terms of voltage.<br>Resolution: 10 bits or equivalent                                                                                                                                                                                                                                                                                                                                                        |
| Analog monitor 2                                 | MO2       | CN3-14            | This signal output the data set in [Pr. PC10] to between MO2 and LG in terms of voltage.<br>Resolution: 10 bits or equivalent                                                                                                                                                                                                                                                                                                                                                            |

#### 3.5.4 Power supply

| Signal name                    | Symbol | Connector pin No. | Function and application                                                                                                                                                                                                                                                                          |
|--------------------------------|--------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Digital I/F power supply input | DICOM  | CN3-5<br>CN3-10   | Input 24 V DC (24 V DC $\pm$ 10% 300 mA) for I/O interface. The power supply capacity changes depending on the number of I/O interface points to be used.<br>For sink interface, connect + of 24 V DC external power supply.<br>For source interface, connect - of 24 V DC external power supply. |
| Digital I/F common             | DOCOM  | CN3-3             | Common terminal of input signal such as EM2 of the servo amplifier. This is separated from LG.<br>For sink interface, connect - of 24 V DC external power supply.<br>For source interface, connect + of 24 V DC external power supply.                                                            |
| Monitor common                 | LG     | CN3-1<br>CN3-11   | Common terminal of MO1 and MO2.<br>Pins are connected internally.                                                                                                                                                                                                                                 |
| Shield                         | SD     | Plate             | Connect the external conductor of the shielded wire.                                                                                                                                                                                                                                              |

### 3. SIGNALS AND WIRING

---

#### 3.6 Forced stop deceleration function

| POINT |                                                                                                                                                                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ●     | When alarms not related to the forced stop function occur, control of motor deceleration cannot be guaranteed. (Refer to chapter 8.)                                                                                                                                                                                                 |
| ●     | When SSCNET III/H communication shut-off occurs, forced stop deceleration will operate. (Refer to section 3.7.1 (3).)                                                                                                                                                                                                                |
| ●     | In the torque control mode, the forced stop deceleration function is not available.                                                                                                                                                                                                                                                  |
| ●     | Disable the forced stop deceleration function for a machine in which multiple axes are connected together, such as a tandem structure. If an alarm occurs with the forced stop deceleration function disabled, the servo motor will stop with the dynamic brake.                                                                     |
| ●     | Keep the servo-on command (from controller) and ready-on command (from controller) on while EM2 (Forced stop 2) is off. When the servo-on command (from controller) or ready-on command (from controller) is off, forced stop deceleration, base circuit shut-off delay time, and vertical axis freefall prevention do not function. |

### 3. SIGNALS AND WIRING

#### 3.6.1 Forced stop deceleration function

When EM2 is turned off, dynamic brake will start to stop the servo motor after forced stop deceleration.

During this sequence, the display shows [AL. E6 Servo forced stop warning].

During normal operation, do not use EM2 (Forced stop 2) to alternate stop and drive. The servo amplifier life may be shortened.

##### (1) Connection diagram

Note. This diagram shows sink I/O interface. For source I/O interface, refer to section 3.8.3.

##### (2) Timing chart

When EM2 (Forced stop 2) is turned off, the motor will decelerate according to [Pr. PC24 Forced stop deceleration time constant]. Once the motor speed is below [Pr. PC07 Zero speed], base power is cut and the dynamic brake activates.

### 3. SIGNALS AND WIRING

#### 3.6.2 Base circuit shut-off delay time function

The base circuit shut-off delay time function is used to prevent vertical axis from dropping at a forced stop (EM2 goes off), alarm occurrence, or SSCNET III/H communication shut-off due to delay time of the electromagnetic brake. Set the time from MBR (Electromagnetic brake interlock) off to base circuit shut-off with [Pr. PC02].

(1) Timing chart

When EM2 (Forced stop 2) turns off or an alarm occurs during driving, the servo motor will decelerate based on the deceleration time constant. MBR (Electromagnetic brake interlock) will turn off, and then after the delay time set in [Pr. PC02], the servo amplifier will be base circuit shut-off status.

(2) Adjustment

While the servo motor is stopped, turn off EM2 (Forced stop 2), adjust the base circuit shut-off delay time in [Pr. PC02], and set the value to approximately 1.5 times of the smallest delay time in which the servo motor shaft does not freefall.

### 3. SIGNALS AND WIRING

#### 3.6.3 Vertical axis freefall prevention function

The vertical axis freefall prevention function avoids machine damage by pulling up the shaft slightly like the following case.

When the servo motor is used for operating vertical axis, the servo motor electromagnetic brake and the base circuit shut-off delay time function avoid dropping axis at forced stop. However, the functions may not avoid dropping axis a few  $\mu\text{m}$  due to the backlash of the servo motor electromagnetic brake.

The vertical axis freefall prevention function is enabled with the following conditions.

- Other than "0" is set to [Pr. PC31 Vertical axis freefall prevention compensation amount].
- EM2 (Forced stop 2) turned off, an alarm occurred, or SSCNET III/H communication shut-off occurred while the servo motor speed is zero speed or less.
- The base circuit shut-off delay time function is enabled.

##### (1) Timing chart

##### (2) Adjustment

- Set the freefall prevention compensation amount in [Pr. PC31].
- While the servo motor is stopped, turn off the EM2 (Forced stop 2). Adjust the base circuit shut-off delay time in [Pr. PC02] in accordance with the travel distance ([Pr. PC31]). Adjust it considering the freefall prevention compensation amount by checking the servo motor speed, torque ripple, etc.

#### 3.6.4 Residual risks of the forced stop function (EM2)

- (1) The forced stop function is not available for alarms that activate the dynamic brake when the alarms occur.
- (2) When an alarm that activates the dynamic brake during forced stop deceleration occurs, the braking distance until the servo motor stops will be longer than that of normal forced stop deceleration without the dynamic brake.
- (3) If STO is turned off during forced stop deceleration, [AL. 63 STO timing error] will occur.

### 3. SIGNALS AND WIRING

#### 3.7 Alarm occurrence timing chart

#### CAUTION

- When an alarm has occurred, remove its cause, make sure that the operation signal is not being input, ensure safety, and reset the alarm before restarting operation.

#### POINT

- In the torque control mode, the forced stop deceleration function is not available.

To deactivate the alarm, cycle the control circuit power or give the error reset or CPU reset command from the servo system controller. However, the alarm cannot be deactivated unless its cause is removed.

##### 3.7.1 When you use the forced stop deceleration function

#### POINT

- To enable the function, set "2 \_ \_ \_ (initial value)" in [Pr. PA04].
- Disable the forced stop deceleration function for a machine in which multiple axes are connected together, such as a tandem structure. If an alarm occurs with the forced stop deceleration function disabled, the servo motor will stop with the dynamic brake.

##### (1) When the forced stop deceleration function is enabled

Note. The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

### 3. SIGNALS AND WIRING

(2) When the forced stop deceleration function is not enabled

(3) When SSCNET III/H communication shut-off occurs

The dynamic brake may operate depending on the communication shut-off status.

Note. The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

3.7.2 When you do not use the forced stop deceleration function

| POINT                                                  |
|--------------------------------------------------------|
| ●To disable the function, set "0 _ _ _" in [Pr. PA04]. |

The timing chart that shows the servo motor condition when an alarm or SSCNET III/H communication shut-off occurs is the same as section 3.7.1 (2).

### 3. SIGNALS AND WIRING

#### 3.8 Interfaces

##### 3.8.1 Internal connection diagram

- Note 1. Signal can be assigned for these pins with the controller setting.  
For contents of signals, refer to the instruction manual of the controller.
- Note 2. The signal cannot be used in the speed control mode and torque control mode.
- Note 3. This diagram shows sink I/O interface. For source I/O interface, refer to section 3.8.3.
- Note 4. This is for MR-J4- \_B\_-RJ servo amplifier. MR-J4- \_B\_ servo amplifier does not have CN2L connector.
- Note 5. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
- Note 6. Refer to table 1.1 for connections of external encoders.

### 3. SIGNALS AND WIRING

#### 3.8.2 Detailed explanation of interfaces

This section provides the details of the I/O signal interfaces (refer to the I/O division in the table) given in section 3.5. Refer to this section and make connection with the external device.

##### (1) Digital input interface DI-1

This is an input circuit whose photocoupler cathode side is the input terminal. Transmit signals from sink (open-collector) type transistor output, relay switch, etc. The following is a connection diagram for sink input. Refer to section 3.8.3 for source input.

##### (2) Digital output interface DO-1

This is a circuit in which the collector of the output transistor is the output terminal. When the output transistor is turned on, the current will flow to the collector terminal.

A lamp, relay or photocoupler can be driven. Install a diode (D) for an inductive load, or install an inrush current suppressing resistor (R) for a lamp load.

(Rated current: 40 mA or less, maximum current: 50 mA or less, inrush current: 100 mA or less) A maximum of 2.6 V voltage drop occurs in the servo amplifier.

The following shows a connection diagram for sink output. Refer to section 3.8.3 for source output.

Note. If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

### 3. SIGNALS AND WIRING

#### (3) Encoder output pulses DO-2 (differential line driver type)

##### (a) Interface

Maximum output current: 35 mA

##### (b) Output pulse

#### (4) Analog output

Note. Output voltage range varies depending on the output contents.

### 3. SIGNALS AND WIRING

#### 3.8.3 Source I/O interfaces

In this servo amplifier, source type I/O interfaces can be used.

##### (1) Digital input interface DI-1

This is an input circuit whose photocoupler anode side is the input terminal. Transmit signals from source (open-collector) type transistor output, relay switch, etc.

##### (2) Digital output interface DO-1

This is a circuit in which the emitter of the output transistor is the output terminal. When the output transistor is turned on, current will be applied from the output to a load.

A maximum of 2.6 V voltage drop occurs in the servo amplifier.

Note. If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

### 3. SIGNALS AND WIRING

#### 3.9 SSCNET III cable connection

##### POINT

- Do not look directly at the light generated from CN1A/CN1B connector of the servo amplifier or the end of SSCNET III cable. The light can be a discomfort when it enters the eye.

##### (1) SSCNET III cable connection

For the CN1A connector, connect the SSCNET III cable connected to a controller in host side or a servo amplifier of the previous axis. For CN1B connector, connect SSCNET III cable connected to servo amplifier of the next axis. For CN1B connector of the final axis, put a cap came with servo amplifier.

##### (2) How to connect/disconnect cable

##### POINT

- CN1A and CN1B connector are capped to protect light device inside connector from dust. For this reason, do not remove the cap until just before connecting the SSCNET III cable. Then, when removing SSCNET III cable, make sure to put a cap.
- Keep the cap for CN1A/CN1B connector and the tube for protecting optical cord end of SSCNET III cable in a plastic bag with a slide fastener of SSCNET III cable to prevent them from becoming dirty.
- When asking repair of servo amplifier for some malfunctions, make sure to cap CN1A and CN1B connector. When the connector is not put a cap, the light device may be damaged at the transit. In this case, replacing and repairing the light device is required.

##### (a) Connection

- 1) For SSCNET III cable in the shipping status, the tube for protect optical cord end is put on the end of connector. Remove this tube.
- 2) Remove the CN1A and CN1B connector caps of the servo amplifier.

### 3. SIGNALS AND WIRING

---

- 3) With holding a tab of SSCNET III cable connector, make sure to insert it into the CN1A and CN1B connector of the servo amplifier until you hear the click. If the end face of optical cord tip is dirty, optical transmission is interrupted and it may cause malfunctions. If it becomes dirty, wipe with a bonded textile, etc. Do not use solvent such as alcohol.

(b) Disconnection

With holding a tab of SSCNET III cable connector, pull out the connector.

When pulling out the SSCNET III cable from servo amplifier, be sure to put the cap on the connector parts of servo amplifier to prevent it from becoming dirty. For SSCNET III cable, attach the tube for protection optical cord's end face on the end of connector.

### 3. SIGNALS AND WIRING

#### 3.10 Servo motor with an electromagnetic brake

##### 3.10.1 Safety precautions

- Configure an electromagnetic brake circuit which is interlocked with an external emergency stop switch.

Contacts must be opened when ALM (Malfunction) or MBR (Electromagnetic brake interlock) turns off.

Contacts must be opened with the emergency stop switch.

#### CAUTION

- The electromagnetic brake is provided for holding purpose and must not be used for ordinary braking.
- Before operating the servo motor, be sure to confirm that the electromagnetic brake operates properly.
- Do not use the 24 V DC interface power supply for the electromagnetic brake. Always use the power supply designed exclusively for the electromagnetic brake. Otherwise, it may cause a malfunction.
- When using EM2 (Forced stop 2), use MBR (Electromagnetic brake interlock) for operating the electromagnetic brake. Operating the electromagnetic brake without using MBR during deceleration to a stop will saturate servo motor torques at the maximum value due to brake torque of the electromagnetic brake. This can result in delay of the deceleration to a stop from a set value.

#### POINT

- Refer to "Servo Motor Instruction Manual (Vol. 3)" for specifications such as the power supply capacity and operation delay time of the electromagnetic brake.
- Refer to "Servo Motor Instruction Manual (Vol. 3)" for the selection of a surge absorber for the electromagnetic brake.

Note the following when the servo motor with an electromagnetic brake is used.

- 1) The electromagnetic brake will operate when the power (24 V DC) turns off.
- 2) Turn off the servo-on command after the servo motor stopped.

##### (1) Connection diagram

- Note
1. Create the circuit in order to shut off by interlocking with the emergency stop switch.
  2. Do not use the 24 V DC interface power supply for the electromagnetic brake.

### 3. SIGNALS AND WIRING

#### (2) Setting

In [Pr. PC02 Electromagnetic brake sequence output], set a delay time (Tb) from MBR (Electromagnetic brake interlock) off to base circuit shut-off at a servo-off as in the timing chart in section 3.10.2.

#### 3.10.2 Timing chart

##### (1) When you use the forced stop deceleration function

| POINT                                                                 |
|-----------------------------------------------------------------------|
| ●To enable the function, set "2 _ _ _ (initial value)" in [Pr. PA04]. |

##### (a) Servo-on command (from controller) on/off

| POINT                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ●Keep the ready-on command (from controller) on while the servo-on command (from controller) is off. When the ready-off command (from controller) is off, Tb [Pr. PC02 Electromagnetic brake sequence output] does not function. |

When servo-on command is turned off, the servo lock will be released after Tb [ms], and the servo motor will coast. If the electromagnetic brake is enabled during servo-lock, the brake life may be shorter. Therefore, set Tb about 1.5 times of the minimum delay time where the moving part will not drop down for a vertical axis system, etc.

Note 1. ON: Electromagnetic brake is not activated.

OFF: Electromagnetic brake is activated.

Note 2. Electromagnetic brake is released after delaying for the release delay time of electromagnetic brake and operation time of external circuit relay. For the release delay time of electromagnetic brake, refer to "Servo Motor Instruction Manual (Vol. 3)".

Note 3. Give the operation command from the controller after the electromagnetic brake is released.

### 3. SIGNALS AND WIRING

(b) Off/on of the forced stop command (from controller) or EM2 (Forced stop 2)

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>● In the torque control mode, the forced stop deceleration function is not available.</li> <li>● Keep the servo-on command (from controller) and ready-on command (from controller) on while the forced stop command (from controller) or the EM2 (Forced stop 2) is off. When the ready-off command (from controller) is off, Tb [Pr. PC02 Electromagnetic brake sequence output] does not function.</li> </ul> |

Note 1. ON: Electromagnetic brake is not activated.  
OFF: Electromagnetic brake is activated.

2. The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

### 3. SIGNALS AND WIRING

#### (c) Alarm occurrence

##### 1) When the forced stop deceleration function is enabled

Note. The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

##### 2) When the forced stop deceleration function is disabled The operation status is the same as section 3.7.1 (2).

### 3. SIGNALS AND WIRING

#### 3) When SSCNET III/H communication shut-off occurs

The dynamic brake may operate depending on the communication shut-off status.

Note. The model speed command is a speed command generated in the servo amplifier for forced stop deceleration of the servo motor.

#### (d) Both main and control circuit power supplies off

- Note
1. Variable according to the operation status.
  2. ON: Electromagnetic brake is not activated.  
OFF: Electromagnetic brake is activated.

### 3. SIGNALS AND WIRING

(e) Main circuit power supply off during control circuit power supply on

| POINT                                                                                 |
|---------------------------------------------------------------------------------------|
| ● In the torque control mode, the forced stop deceleration function is not available. |

Note 1. ON: Electromagnetic brake is not activated.  
 OFF: Electromagnetic brake is activated.  
 2. Variable according to the operation status.

(f) Ready-off command from controller

Note. ON: Electromagnetic brake is not activated.  
 OFF: Electromagnetic brake is activated.

### 3. SIGNALS AND WIRING

(2) When you do not use the forced stop deceleration function

| POINT                                                  |
|--------------------------------------------------------|
| ●To disable the function, set "0 _ _ _" in [Pr. PA04]. |

(a) Servo-on command (from controller) on/off

It is the same as (1) (a) in this section.

(b) Off/on of the forced stop command (from controller) or EM1 (Forced stop 1)

Note. ON: Electromagnetic brake is not activated.

OFF: Electromagnetic brake is activated.

(c) Alarm occurrence

The operation status during an alarm is the same as section 3.7.2.

(d) Both main and control circuit power supplies off

It is the same as (1) (d) in this section.

(e) Main circuit power supply off during control circuit power supply on

Note 1. Variable according to the operation status.

2. ON: Electromagnetic brake is not activated.

OFF: Electromagnetic brake is activated.

### 3. SIGNALS AND WIRING

- (f) Ready-off command from controller  
It is the same as (1) (f) in this section.

#### 3.11 Grounding

**⚠ WARNING** ● Ground the servo amplifier and servo motor securely.  
● To prevent an electric shock, always connect the protective earth (PE) terminal (marked  $\oplus$ ) of the servo amplifier to the protective earth (PE) of the cabinet.

The servo amplifier switches the power transistor on-off to supply power to the servo motor. Depending on the wiring and ground cable routing, the servo amplifier may be affected by the switching noise (due to di/dt and dv/dt) of the transistor. To prevent such a fault, refer to the following diagram and always ground. To conform to the EMC Directive, refer to "EMC Installation Guidelines".

Note. For the power supply specifications, refer to section 1.3.

## 4. STARTUP

---

### 4. STARTUP

#### WARNING

- When executing a test run, follow the notice and procedures in this instruction manual. Otherwise, it may cause a malfunction, damage to the machine, or injury.
- Do not operate the switches with wet hands. Otherwise, it may cause an electric shock.

#### CAUTION

- Before starting operation, check the parameters. Improper settings may cause some machines to operate unexpectedly.
- The servo amplifier heat sink, regenerative resistor, servo motor, etc., may be hot while the power is on and for some time after power-off. Take safety measures such as providing covers to avoid accidentally touching them by hands and parts such as cables.
- During operation, never touch the rotor of the servo motor. Otherwise, it may cause injury.
- Before wiring, switch operation, etc., eliminate static electricity. Otherwise, it may cause a malfunction.

#### POINT

- When you use a linear servo motor, replace the following words in the left to the words in the right.

|                             |                              |
|-----------------------------|------------------------------|
| Load to motor inertia ratio | → Load to motor mass ratio   |
| Torque                      | → Thrust                     |
| (Servo motor) speed         | → (Linear servo motor) speed |

## 4. STARTUP

---

### 4.1 Switching power on for the first time

When switching power on for the first time, follow this section to make a startup.

#### 4.1.1 Startup procedure

## 4. STARTUP

### 4.1.2 Wiring check

#### (1) Power supply system wiring

Before switching on the main circuit and control circuit power supplies, check the following items.

##### (a) Power supply system wiring

- 1) The power supplied to the power input terminals (L1/L2/L3/L11/L21) of the servo amplifier should satisfy the defined specifications. (Refer to section 1.3.)
- 2) When the power factor improving DC reactor is not used, between P3 and P4 should be connected.

Note. The 100 V class servo amplifiers do not have P3 and P4.

##### (b) Connection of servo amplifier and servo motor

- 1) The servo amplifier power output (U/V/W) should match in phase with the servo motor power input terminals (U/V/W).

- 2) The power supplied to the servo amplifier should not be connected to the servo motor power terminals (U/V/W). Otherwise, the servo amplifier and servo motor will malfunction.

- 3) The grounding terminal of the servo motor is connected to the PE terminal of the servo amplifier.

- 4) The CN2 connector of the servo amplifier should be connected to the encoder of the servo motor securely using the encoder cable.

## 4. STARTUP

---

(c) When you use an option and auxiliary equipment

1) 200 V class

a) When you use a regenerative option for 5 kW or less servo amplifiers

- The lead wire between P+ terminal and D terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- Twisted wires cable should be used. (Refer to section 11.2.4.)

b) When you use a regenerative option for 7 kW or more servo amplifiers

- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- The regenerative option wire should be connected between P+ and C terminal.
- Twisted wires cable should be used. (Refer to section 11.2.4.)

c) When you use a brake unit and power regeneration converter for 5 kW or more servo amplifiers

- For 5 kW or less servo amplifiers, the lead wire between P+ terminal and D terminal should not be connected.
- For 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- Brake unit, power regeneration converter should be connected to P+ terminal and N-terminal. (Refer to section 11.3 and 11.4.)
- Twisted wires cable should be used when wiring is over 5 m and equal to or less than 10 m using a brake unit. (Refer to section 11.3)

d) When you use a power regeneration common converter

- For 5 kW or less servo amplifiers, the lead wire between P+ terminal and D terminal should not be connected.
- For 7 kW servo amplifiers, the lead wire of built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
- The wire of power regeneration common converter should be connected to P4 terminal and N- terminal. (Refer to section 11.5.)

e) The power factor improving DC reactor should be connected between P3 and P4. (Refer to section 11.11.)

Note. Always disconnect between P3 and P4 terminals.

2) 400 V class

a) When you use a regenerative option for 3.5 kW or less servo amplifiers

- The lead wire between P+ terminal and D terminal should not be connected.
- The regenerative option should be connected to P+ terminal and C terminal.
- Twisted wires cable should be used. (Refer to section 11.2.4.)

## 4. STARTUP

---

- b) When you use a regenerative option for 5 kW or more servo amplifiers
- For 5 kW or 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
  - The regenerative option should be connected to P+ terminal and C terminal.
  - Twisted wires cable should be used. (Refer to section 11.2.4.)
- c) When you use a brake unit and power regeneration converter for 5 kW or more servo amplifiers
- For 5 kW or 7 kW servo amplifiers, the lead wire of the built-in regenerative resistor connected to P+ terminal and C terminal should not be connected.
  - Brake unit, power regeneration converter should be connected to P+ terminal and N-terminal. (Refer to section 11.3 and 11.4.)
  - Twisted wires cable should be used when wiring is over 5 m and equal to or less than 10 m using a brake unit. (Refer to section 11.3)
- d) When you use a power regeneration common converter for 11 kW or more servo amplifiers
- Power regeneration common converter should be connected to P4 terminal and N- terminal. (Refer to section 11.5.)
- e) The power factor improving DC reactor should be connected between P3 and P4. (Refer to section 11.11.)

Note. Always disconnect between P3 and P4.

### 3) 100 V class

- The lead wire between P+ terminal and D terminal should not be connected.
- The regenerative option should be connected to P+ terminal and C terminal.
- Twisted wires cable should be used. (Refer to section 11.2.4.)

### (2) I/O signal wiring

- (a) The I/O signals should be connected correctly.

Use DO forced output to forcibly turn on/off the pins of the CN3 connector. You can use this function to check the wiring. In this case, switch on the control circuit power supply only.

Refer to section 3.2 for details of I/O signal connection.

- (b) 24 V DC or higher voltage is not applied to the pins of the CN3 connector.
- (c) Plate and DOCOM of the CN3 connector is not shorted.

## 4. STARTUP

---

### 4.1.3 Surrounding environment

#### (1) Cable routing

- (a) The wiring cables should not be stressed.
- (b) The encoder cable should not be used in excess of its bending life. (Refer to section 10.4.)
- (c) The connector of the servo motor should not be stressed.

#### (2) Environment

Signal cables and power cables are not shorted by wire offcuts, metallic dust or the like.

### 4.2 Startup

Connect the servo motor with a machine after confirming that the servo motor operates properly alone.

#### (1) Power on

When the main and control circuit power supplies are turned on, "b01" (for the first axis) appears on the servo amplifier display.

When the absolute position detection system is used in a rotary servo motor, first power-on results in [AL. 25 Absolute position erased] and the servo-on cannot be ready. The alarm can be deactivated by then switching power off once and on again.

Also, if power is switched on at the servo motor speed of 3000 r/min or higher, position mismatch may occur due to external force or the like. Power must therefore be switched on when the servo motor is at a stop.

#### (2) Parameter setting

| POINT                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ● The following encoder cables are of four-wire type. When using any of these encoder cables, set [Pr. PC04] to "1 _ _ _" to select the four-wire type. Incorrect setting will result in [AL. 16 Encoder initial communication error 1].<br>MR-EKCBL30M-L<br>MR-EKCBL30M-H<br>MR-EKCBL40M-H<br>MR-EKCBL50M-H |

Set the parameters according to the structure and specifications of the machine. Refer to chapter 5 for details.

After setting the above parameters, turn power off as necessary. Then switch power on again to enable the parameter values.

#### (3) Servo-on

Enable the servo-on with the following procedure.

- (a) Switch on main circuit power supply and control circuit power supply.
- (b) Transmit the servo-on command with the servo system controller.

When the servo-on status is enabled, the servo amplifier is ready to operate and the servo motor is locked.

## 4. STARTUP

---

(4) Home position return

Always perform home position return before starting positioning operation.

(5) Stop

Turn off the servo-on command after the servo motor has stopped, and then switch the power off.

If any of the following situations occurs, the servo amplifier suspends the running of the servo motor and brings it to a stop.

Refer to section 3.10 for the servo motor with an electromagnetic brake.

|                         | Operation/command       | Stopping condition                                                                                                                                                                            |
|-------------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Servo system controller | Servo-off command       | The base circuit is shut off and the servo motor coasts.                                                                                                                                      |
|                         | Ready-off command       | The base circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.                                                                                               |
|                         | Forced stop command     | The servo motor decelerates to a stop with the command. [AL. E7 Controller forced stop warning] occurs.                                                                                       |
| Servo amplifier         | Alarm occurrence        | The servo motor decelerates to a stop with the command. With some alarms, however, the dynamic brake operates to bring the servo motor to a stop. (Refer to section 8. (Note))                |
|                         | EM2 (Forced stop 2) off | The servo motor decelerates to a stop with the command. [AL. E6 Servo forced stop warning] occurs. EM2 has the same function as EM1 in the torque control mode. Refer to section 3.5 for EM1. |
|                         | STO (STO1, STO2) off    | The base circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.                                                                                               |

Note. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

## 4. STARTUP

### 4.3 Switch setting and display of the servo amplifier

Switching to the test operation mode, deactivating control axes, and setting control axis No. are enabled with switches on the servo amplifier.

On the servo amplifier display (three-digit, seven-segment LED), check the status of communication with the servo system controller at power-on, and the axis number, and diagnose a malfunction at occurrence of an alarm.

#### 4.3.1 Switches

### WARNING

- When switching the axis selection rotary switch (SW1) and auxiliary axis number setting switch (SW2), use insulated screw driver. Do not use a metal screw driver. Touching patterns on electronic boards, lead of electronic parts, etc. may cause an electric shock.

#### POINT

- Turning "ON (up)" all the control axis setting switches (SW2) enables an operation mode for manufacturer setting and displays "off". The mode is not available. Set the control axis setting switches (SW2) correctly according to this section.
- Cycling the main circuit power supply and control circuit power supply enables the setting of each switch.

The following explains the test operation select switch, the disabling control axis switch, auxiliary axis number setting switches, and the axis selection rotary switch.

#### (1) Test operation select switch (SW2-1)

To use the test operation mode, turn "ON (up)" the switch. Turning "ON (up)" the switch enables the test operation mode. In the test operation mode, the functions such as JOG operation, positioning operation, and machine analyzer are available with MR Configurator2. Before turning "ON (up)" the test operation select switch, turn "OFF (down)" the disabling control axis switch.

## 4. STARTUP

### (2) Disabling control axis switch (SW2-2)

Turning "ON (up)" the disabling control axis switch disables the corresponding servo motor. The servo motor will be disabled-axis status and will not be recognized by the controller.

Disabling control axis switch

### (3) Switches for setting control axis No.

| POINT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>● The control axis No. set to the auxiliary axis number setting switches (SW2-3 and SW2-4) and the axis selection rotary switch (SW1) should be the same as the one set to the servo system controller. The number of the axes you can set depends on the servo system controller.</li> <li>● For setting the axis selection rotary switch, use a flat-blade screwdriver with the blade edge width of 2.1 mm to 2.3 mm and the blade edge thickness of 0.6 mm to 0.7 mm.</li> <li>● When the test operation mode is selected with the test operation select switch (SW2-1), the SSCNET III/H communication for the servo amplifier in the test operation mode and the following servo amplifiers is blocked.</li> </ul> |

You can set the control axis No. between 1 and 64 by using auxiliary axis number setting switches with the axis selection rotary switch. (Refer to (3) (c) in this section.)

If the same numbers are set to different control axes in a single communication system, the system will not operate properly. The control axes may be set independently of the SSCNET III cable connection sequence. The following shows the description of each switch.

#### (a) Auxiliary axis number setting switches (SW2-3 and SW2-4)

Turning these switches "ON (up)" enables you to set the axis No. 17 or more.

#### (b) Axis selection rotary switch (SW1)

You can set the control axis No. between 1 and 64 by using auxiliary axis number setting switches with the axis selection rotary switch. (Refer to (3) (c) in this section.)

Axis selection rotary switch (SW1)

## 4. STARTUP

### (c) Switch combination list for the control axis No. setting

| POINT                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------|
| <p>● Set control axis Nos. for one system. For details of the control axis No., refer to the servo system controller user's manual.</p> |

The following lists show the setting combinations of the auxiliary axis number setting switches and the axis selection rotary switch.

| Auxiliary axis number setting switch | Axis selection rotary switch | Control axis No. |
|--------------------------------------|------------------------------|------------------|
|                                      | 0                            | 1                |
|                                      | 1                            | 2                |
|                                      | 2                            | 3                |
|                                      | 3                            | 4                |
|                                      | 4                            | 5                |
|                                      | 5                            | 6                |
|                                      | 6                            | 7                |
|                                      | 7                            | 8                |
|                                      | 8                            | 9                |
|                                      | 9                            | 10               |
|                                      | A                            | 11               |
|                                      | B                            | 12               |
|                                      | C                            | 13               |
|                                      | D                            | 14               |
|                                      | E                            | 15               |
|                                      | F                            | 16               |

| Auxiliary axis number setting switch | Axis selection rotary switch | Control axis No. |
|--------------------------------------|------------------------------|------------------|
|                                      | 0                            | 17               |
|                                      | 1                            | 18               |
|                                      | 2                            | 19               |
|                                      | 3                            | 20               |
|                                      | 4                            | 21               |

## 4. STARTUP

### 4.3.2 Scrolling display

#### (1) Normal display

When there is no alarm, the axis No. and blank are displayed in rotation.

#### (2) Alarm display

When an alarm occurs, the alarm number (two digits) and the alarm detail (one digit) are displayed following the status display. For example, the following shows when [AL. 32 Overcurrent] is occurring.

## 4. STARTUP

### 4.3.3 Status display of an axis

#### (1) Display sequence

Note. 

|    |    |     |    |
|----|----|-----|----|
| 01 | 02 | ... | 64 |
|----|----|-----|----|

 The segment of the last 2 digits shows the axis number.

Axis No. 1    Axis No. 2    ...    Axis No. 64

## 4. STARTUP

### (2) Indication list

| Indication                                                                                                                                                                                                                                                                 | Status                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

(Note 4))                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                                                                                                                                                         | CPU error                       | CPU watchdog error has occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| (Note 1) <br><br> | (Note 3)<br>Test operation mode | JOG operation, positioning operation, program operation, output signal (DO) forced output, or motor-less operation was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Note 1. The meanings of ## are listed below.

| ## | Description |
|----|-------------|
| 01 | Axis No. 1  |
| to | to          |
| 64 | Axis No. 64 |

2. \*\* indicates the alarm No. and the warning No.

3. Requires the MR Configurator2.

4. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

## 4. STARTUP

### 4.4 Test operation

Before starting actual operation, perform test operation to make sure that the machine operates normally. Refer to section 4.2 for the power on and off methods of the servo amplifier.

#### POINT

- If necessary, verify controller program by using motor-less operation. Refer to section 4.5.2 for the motor-less operation.

Test operation of the servo motor alone in JOG operation of test operation mode

In this step, confirm that the servo amplifier and servo motor operate normally. With the servo motor disconnected from the machine, use the test operation mode and check whether the servo motor rotates correctly. Refer to section 4.5 for the test operation mode.

Test operation of the servo motor alone by commands

In this step, confirm that the servo motor rotates correctly under the commands from the controller.

Give a low speed command at first and check the rotation direction, etc. of the servo motor. If the machine does not operate in the intended direction, check the input signal.

Test operation with the servo motor and machine connected

In this step, connect the servo motor with the machine and confirm that the machine operates normally under the commands from the controller.

Give a low speed command at first and check the operation direction, etc. of the machine. If the machine does not operate in the intended direction, check the input signal.

Check any problems with the servo motor speed, load ratio, and other status display items with MR Configurator2.

Then, check automatic operation with the program of the controller.

### 4.5 Test operation mode

#### CAUTION

- The test operation mode is designed for checking servo operation. It is not for checking machine operation. Do not use this mode with the machine. Always use the servo motor alone.
- If the servo motor operates abnormally, use EM2 (Forced stop 2) to stop it.

#### POINT

- The content described in this section indicates that the servo amplifier and a personal computer are directly connected.

By using a personal computer and MR Configurator2, you can execute jog operation, positioning operation, output signal (DO) forced output program operation without connecting the servo system controller.

## 4. STARTUP

### 4.5.1 Test operation mode in MR Configurator2

| POINT                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ● When the test operation mode is selected with the test operation select switch (SW2-1), the SSCNET III/H communication for the servo amplifier in the test operation mode and the following servo amplifiers is blocked. |

#### (1) Test operation mode

##### (a) Jog operation

Jog operation can be performed without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the jog operation screen of MR Configurator2.

##### 1) Operation pattern

| Item                                         | initial value | Setting range   |
|----------------------------------------------|---------------|-----------------|
| Speed [r/min]                                | 200           | 0 to max. speed |
| Acceleration/deceleration time constant [ms] | 1000          | 0 to 50000      |

##### 2) Operation method

- When the check box of "Rotation only while the CCW or CW button is being pushed." is checked.

| Operation              | Screen control                  |
|------------------------|---------------------------------|
| Forward rotation start | Keep pressing "Forward".        |
| Reverse rotation start | Keep pressing "Reverse".        |
| Stop                   | Release "Forward" or "Reverse". |
| Forced stop            | Click "Forced stop".            |

- When the check box of "Rotation only while the CCW or CW button is being pushed." is not checked.

| Operation              | Screen control       |
|------------------------|----------------------|
| Forward rotation start | Click "Forward".     |
| Reverse rotation start | Click "Reverse".     |
| Stop                   | Click "Stop".        |
| Forced stop            | Click "Forced stop". |

## 4. STARTUP

### (b) Positioning operation

Positioning operation can be performed without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the positioning operation screen of MR Configurator2.

#### 1) Operation pattern

| Item                                         | initial value                     | Setting range                                                                                                                                    |
|----------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Travel distance [pulse]                      | 4000                              | 0 to 99999999                                                                                                                                    |
| Speed [r/min]                                | 200                               | 0 to max. speed                                                                                                                                  |
| Acceleration/deceleration time constant [ms] | 1000                              | 0 to 50000                                                                                                                                       |
| Repeat pattern                               | Fwd. rot. (CCW) to rev. rot. (CW) | Fwd. rot. (CCW) to rev. rot. (CW)<br>Fwd. rot. (CCW) to fwd. rot. (CCW)<br>Rev. rot. (CW) to fwd. rot. (CCW)<br>Rev. rot. (CW) to rev. rot. (CW) |
| Dwell time [s]                               | 2.0                               | 0.1 to 50.0                                                                                                                                      |
| Number of repeats [time]                     | 1                                 | 1 to 9999                                                                                                                                        |

#### 2) Operation method

| Operation              | Screen control       |
|------------------------|----------------------|
| Forward rotation start | Click "Forward".     |
| Reverse rotation start | Click "Reverse".     |
| Pause                  | Click "Pause".       |
| Stop                   | Click "Stop".        |
| Forced stop            | Click "Forced stop". |

### (c) Program operation

Positioning operation can be performed in two or more operation patterns combined, without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the program operation screen of MR Configurator2. For details, refer to Help of MR Configurator2.

| Operation   | Screen control       |
|-------------|----------------------|
| Start       | Click "Start".       |
| Pause       | Click "Pause".       |
| Stop        | Click "Stop".        |
| Forced stop | Click "Forced stop". |

### (d) Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. Use this function for output signal wiring check, etc. Exercise control on the DO forced output screen of MR Configurator2.

## 4. STARTUP

### (2) Operation procedure

- 1) Turn off the power.
- 2) Turn "ON (up)" SW2-1.

Turning "ON (up)" SW2-1 during power-on will not start the test operation mode.

### 3) Turn on the servo amplifier.

When initialization is completed, the decimal point on the first digit will blink.

When an alarm or warning also occurs during the test operation, the decimal point on the first digit will blink as follows.

### 4) Start operation with the personal computer.

## 4. STARTUP

### 4.5.2 Motor-less operation in controller

| POINT |                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------|
| ●     | Use motor-less operation which is available by making the servo system controller servo parameter setting.                              |
| ●     | Connect the servo system controller to the servo amplifier before the motor-less operation.                                             |
| ●     | The motor-less operation is not used in the fully closed loop control mode, linear servo motor control mode, and DD motor control mode. |

#### (1) Motor-less operation

Without connecting the servo motor to the servo amplifier, output signals or status displays can be provided in response to the servo system controller commands as if the servo motor is actually running. This operation may be used to check the servo system controller sequence. Use this operation with the forced stop reset. Use this operation with the servo amplifier connected to the servo system controller. To stop the motor-less operation, set the motor-less operation selection to "Disable" in the servo parameter setting of the servo system controller. When the power supply is turned on next time, motor-less operation will be disabled.

#### (a) Load conditions

| Load item                   | Condition                                                       |
|-----------------------------|-----------------------------------------------------------------|
| Load torque                 | 0                                                               |
| Load to motor inertia ratio | [Pr. PB06 Load to motor inertia ratio/load to motor mass ratio] |

#### (b) Alarms

The following alarms and warning do not occur. However, the other alarms and warnings occur as when the servo motor is connected.

- [AL. 16 Encoder initial communication error 1]
- [AL. 1E Encoder initial communication error 2]
- [AL. 1F Encoder initial communication error 3]
- [AL. 20 Encoder normal communication error 1]
- [AL. 21 Encoder normal communication error 2]
- [AL. 25 Absolute position erased]
- [AL. 92 Battery cable disconnection warning]
- [AL. 9F Battery warning]

## 4. STARTUP

---

### (2) Operation procedure

- 1) Set the servo amplifier to the servo-off status.
- 2) Set [Pr. PC05] to "\_\_\_ 1", turn "OFF (down: normal condition side)" the test operation mode switch (SW2-1), and then turn on the power supply.

- 3) Start the motor-less operation with the servo system controller.  
The display shows the following screen.

[illegible]

## 5. PARAMETERS

### 5. PARAMETERS

#### CAUTION

- Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.
- Do not change the parameter settings as described below. Doing so may cause an unexpected condition, such as failing to start up the servo amplifier.
  - Changing the values of the parameters for manufacturer setting
  - Setting a value out of the range
  - Changing the fixed values in the digits of a parameter
- When you write parameters with the controller, make sure that the control axis No. of the servo amplifier is set correctly. Otherwise, the parameter settings of another axis may be written, possibly causing the servo amplifier to be an unexpected condition.

#### POINT

- When you connect the amplifier to a servo system controller, servo parameter values of the servo system controller will be written to each parameter.
- Setting may not be made to some parameters and their ranges depending on the servo system controller model, servo amplifier software version, and MR Configurator2 software version. For details, refer to the servo system controller user's manual. Check the software version of the servo amplifier using MR Configurator2.

#### 5.1 Parameter list

#### POINT

- The parameter whose symbol is preceded by \* is enabled with the following conditions:
  - \*: After setting the parameter, cycle the power or reset the controller.
  - \*\*: After setting the parameter, cycle the power.
- Abbreviations of operation modes indicate the followings.
  - Standard: Semi closed loop system use of the rotary servo motor
  - Full.: Fully closed loop system use of the rotary servo motor
  - Lin.: Linear servo motor use
  - D.D.: Direct drive motor use
- For servo amplifier with software version B3 or later, the parameter initial values for the manufacturer setting are partially changed.

## 5. PARAMETERS

### 5.1.1 Basic setting parameters ([Pr. PA\_ \_])

| No.  | Symbol | Name                                                    | Initial value | Unit        | Operation mode        |                       |                       |                       |
|------|--------|---------------------------------------------------------|---------------|-------------|-----------------------|-----------------------|-----------------------|-----------------------|
|      |        |                                                         |               |             | Standard              | Full.                 | Lin.                  | D.D.                  |

PF25 SEMI-F47 function - Instantaneous power failure detection time].<br>To enable the torque limit function at instantaneous power failure, select "Enabled ( _ 1 _ )" of "SEMI-F47 function selection" in [Pr. PA20].<br>This parameter setting is used with servo amplifier with software version A6 or later. | 0h | __ x _ | For manufacturer setting | 0h | _ x _ _ | 0h | x _ _ _ | 0h | Refer to the "Name and function" column. |  |
| Setting digit | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Initial value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                         |               |               |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |        |                          |    |         |    |         |    |                                          |  |
| ___ x         | Torque limit function selection at instantaneous power failure (instantaneous power failure tough drive selection)<br>0: Disabled<br>1: Enabled<br>When an instantaneous power failure occurs during operation, you can save electric energy charged in the capacitor in the servo amplifier by limiting torque at acceleration. You can also delay the time until [AL. 10.2 Voltage drop in the main circuit power] occurs with instantaneous power failure tough drive function. Doing this will enable you to set a longer time in [Pr. PF25 SEMI-F47 function - Instantaneous power failure detection time].<br>To enable the torque limit function at instantaneous power failure, select "Enabled ( _ 1 _ )" of "SEMI-F47 function selection" in [Pr. PA20].<br>This parameter setting is used with servo amplifier with software version A6 or later. | 0h                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                         |               |               |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |        |                          |    |         |    |         |    |                                          |  |

When the super trace control is enabled, constant speed and uniform acceleration/deceleration droop pulses will be almost 0. However, sudden acceleration/deceleration will increase the overshoot. As a guideline, when the feed forward gain setting is 100%, set 1 s or more as the acceleration time constant up to the rated speed.                                                                                                                                                                                                                                                                                                                                         | 0 [%]                                    | 0 to 100      |                                                                                                                                                                                                                                                                                                                         |               |               |      |                                                                                                                                                                                                           |    |      |                                                                                                                                                                                                                                                                                                                         |    |      |                          |    |      |                                                                                                                                                                                                                                                                                                                           |    |

The setting range of this parameter varies, depending on the value in [Pr. PB07]. If a value out of the range is set, the vibration suppression control will be disabled. Refer to section 7.1.5 for details.                                                                                                                                                                              | 100.0<br>[Hz]           | 0.1<br>to<br>300.0 |               |         |                                                                                                                                                                                                                                                                                |    |         |                                                                                       |    |         |                          |    |         |    |                                          |  |

When the servo motor shaft is to be locked mechanically after positioning completion (stop), enabling PID control and completing positioning simultaneously will suppress the unnecessary torque generated to compensate for a position shift. | 0h            |               |       |                                                                                                                                                                                                                                                                                                       |    |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |         |                          |    |         |  |    |
